1) CRITICAL! SARS-CoV-2 IS AN IgE BINDING DISEASE OF THE SPIKE PROTEIN TO IgE!

This is why it mimics allergies. This is why virtually every initial infection is mild - asymptomatic.

It is a TYPE 2 INNATE IMMUNE RESPONSE DISEASE!

This is the response usually reserved for

2) HELMINTHS! THIS IS WHY IVERMECTIN WORKS!

The Spike Protein vaccines are EXTREMELY DANGEROUS as they are sensitizing individuals to the Spike Protein to develop IgE antibodies. This is why the SECOND DOSE elicits stronger reactions. However, the Spike Protein is not

3) replicating. Exposure to the Wild Virus may result in a catastrophic Type 2 response.

The Spike Protein also binds to nAChR receptors. This further ENHANCES an OVERACTIVE TYPE 2 IMMUNE RESPONSE. This results in the catastrophic cytokine storm which also induces self-attack.

4) This is why we are seeing a panoply of autoimmune disease after SARS-CoV-2 infection. The immune system is transformed in many. It goes from being a Renoir to a Jackson Pollack. The disease is designed to induce either death or autoimmunity. Repeated infections will increase

5) the dysregulation. All contact with the Spike Protein must be avoided. Therapeutics must be developed.
I beg the health community to stop the Spike Protein vaccines. They WILL kill. It does not appear so initially, due to sensitization and low dose. As I have said, Long COVID

6) is a sustained Type 2 immune response. The virus is most likely replicating in the CNS.
