10 HTML and CSS tips that you need to know■

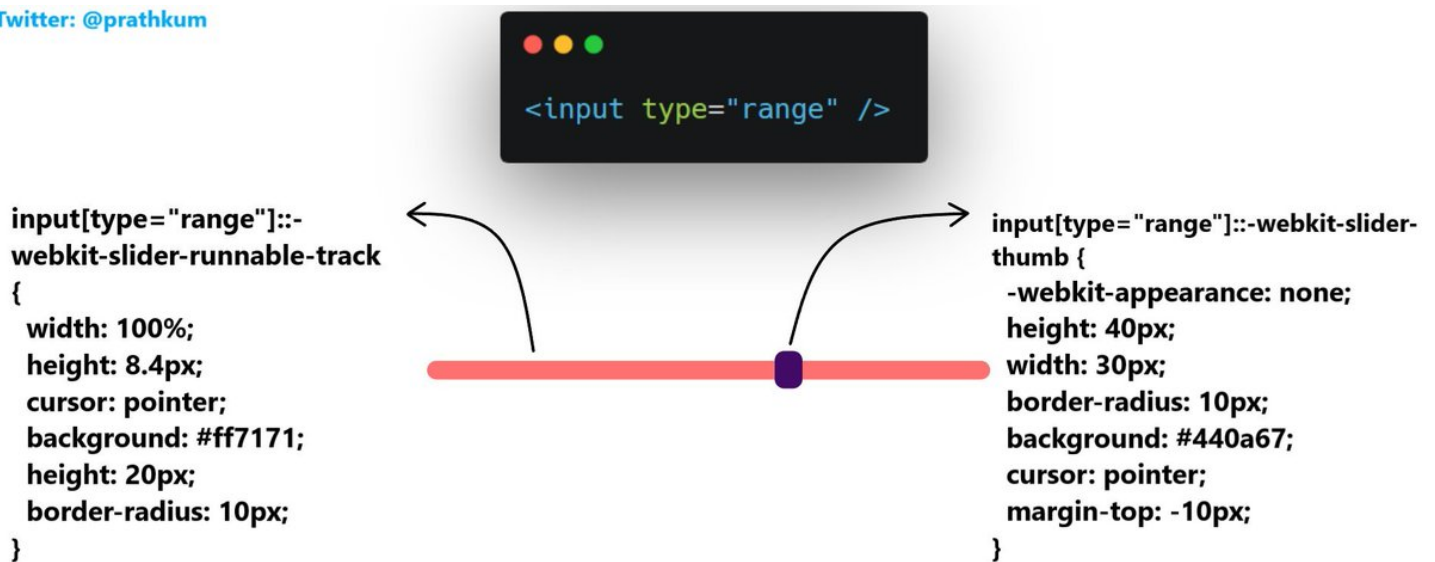

1■■■ Customize the text selection

- The `::selection` pseudo-element matches the portion of an element that is selected by a user.

```
h1::selection {  
  background: #e11d74;  
  color: white;  
}
```

2■■■ Range Input

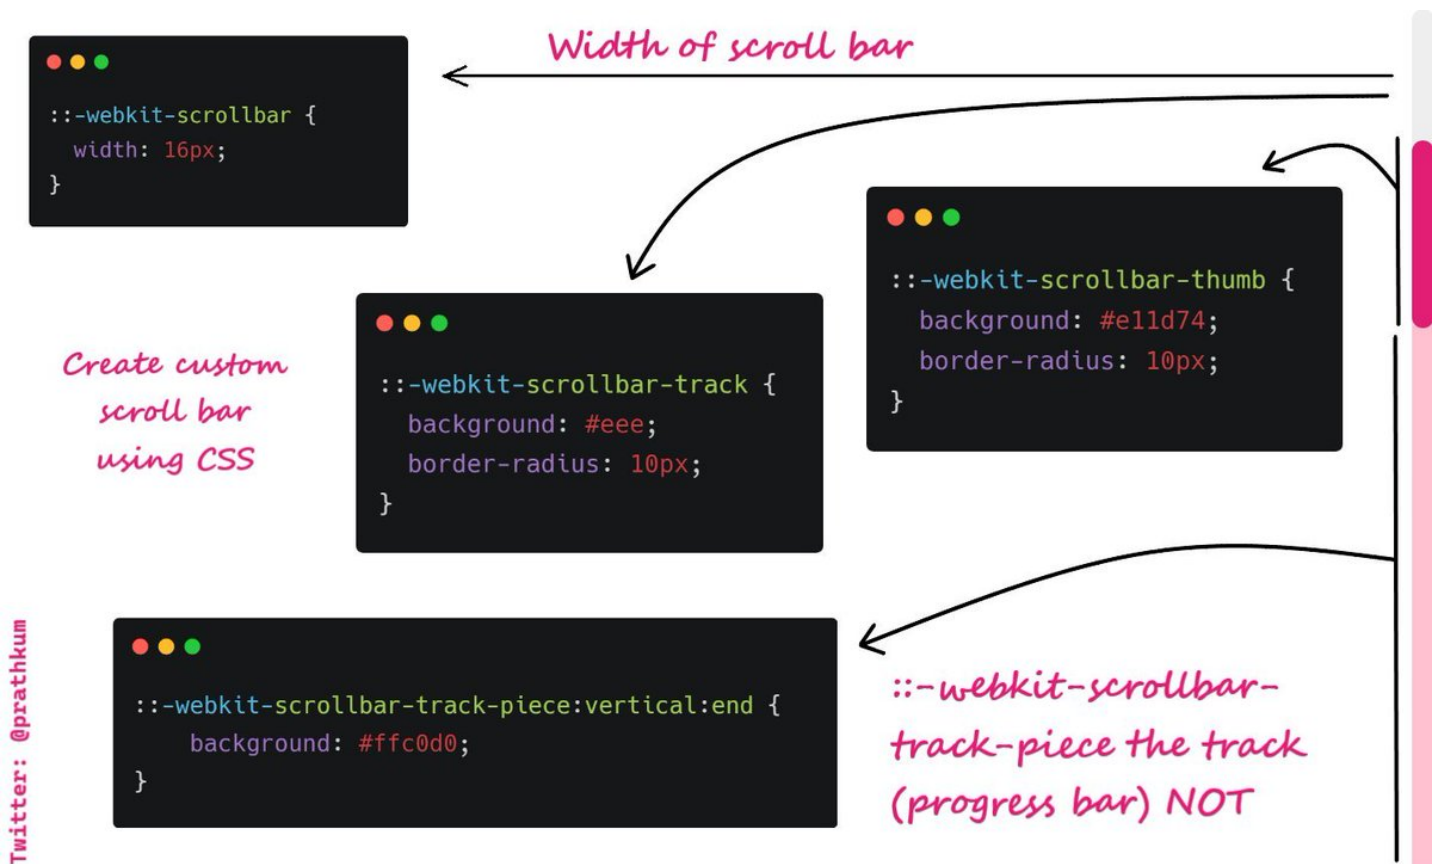

- You can change the styling of `input type="range"`

Made with ❤ by Pratham

3 Custom Scrollbar

- Customize the scrollbar of your website in few minutes

4 Scrollable element

- If you have some fixed size element then use `overflow: auto`. It will convert your element into scrollable element

Lorem ipsum dolor sit amet consectetur adipisicing elit. 5 ■ ■ Underline text like a pro

- You can create "wavy" line using one line of CSS

```
HTML CSS 11 unsaved changes X
1 h1 {
2   text-decoration: underline wavy;
3 }
```

This is a wavy underline

6 ■ ■ will-change property

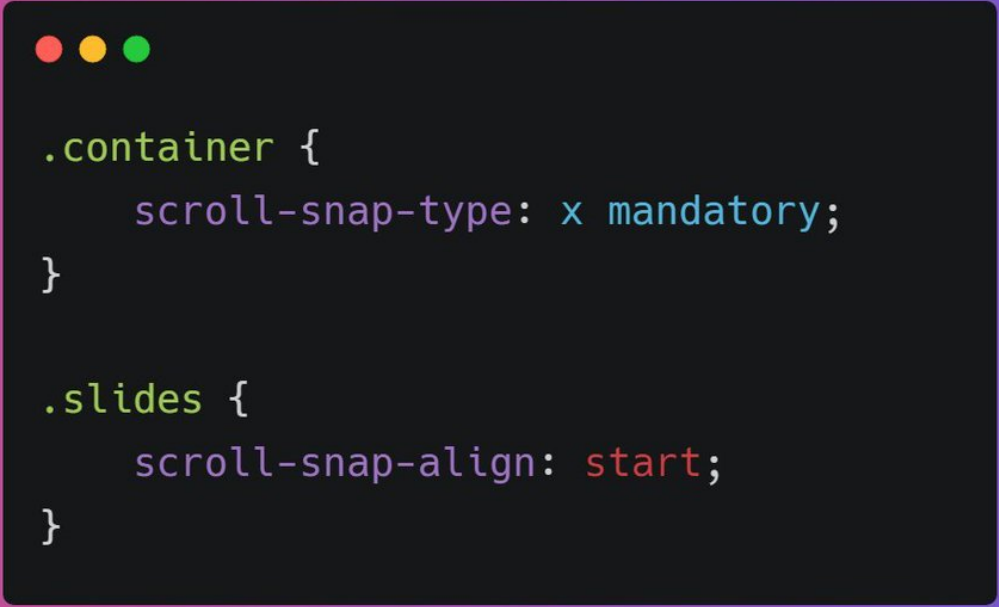

- You can optimize the performance of your web page by adding one line of CSS. will-change tells the browser that how an element is expected to change

A code editor window with a dark background and three colored window control buttons (red, yellow, green) in the top left corner. It contains CSS code for a class.

```
.class {  
  will-change: transform;  
}
```

7 ■ Image Carousel

- You can create carousel using 2 lines of CSS

A code editor window with a dark background and three colored window control buttons (red, yellow, green) in the top left corner. It contains CSS code for a container and slides.

```
.container {  
  scroll-snap-type: x mandatory;  
}  
  
.slides {  
  scroll-snap-align: start;  
}
```

8■■ Regular Expression

- You can use "pattern" attribute in order to specifies the regular expression

```
<input type="password" pattern="(?!.*\d)(?!.*[a-z])(?!.*[A-Z]).{8,}">
```

9■■ Intact your company name

- Use "translate" attribute and set it value to "no" for your company name. So that in case, the webpage is translated into another language, your brand name will remain intact

```
<footer>  
  <p translate="no">Company Name</p>  
</footer>
```

■■ Icons using HTML

- You can use HTML entity or HTML code to print some cool symbols or icons

```
<h1>&check;</h1>
```

```
<h1>&cross;</h1>
```

```
<h1>&mal't;</h1>
```

```
<h1>&sext;</h1>
```
