Can #cardano \$ada pull a 100X price move from here... realistically?

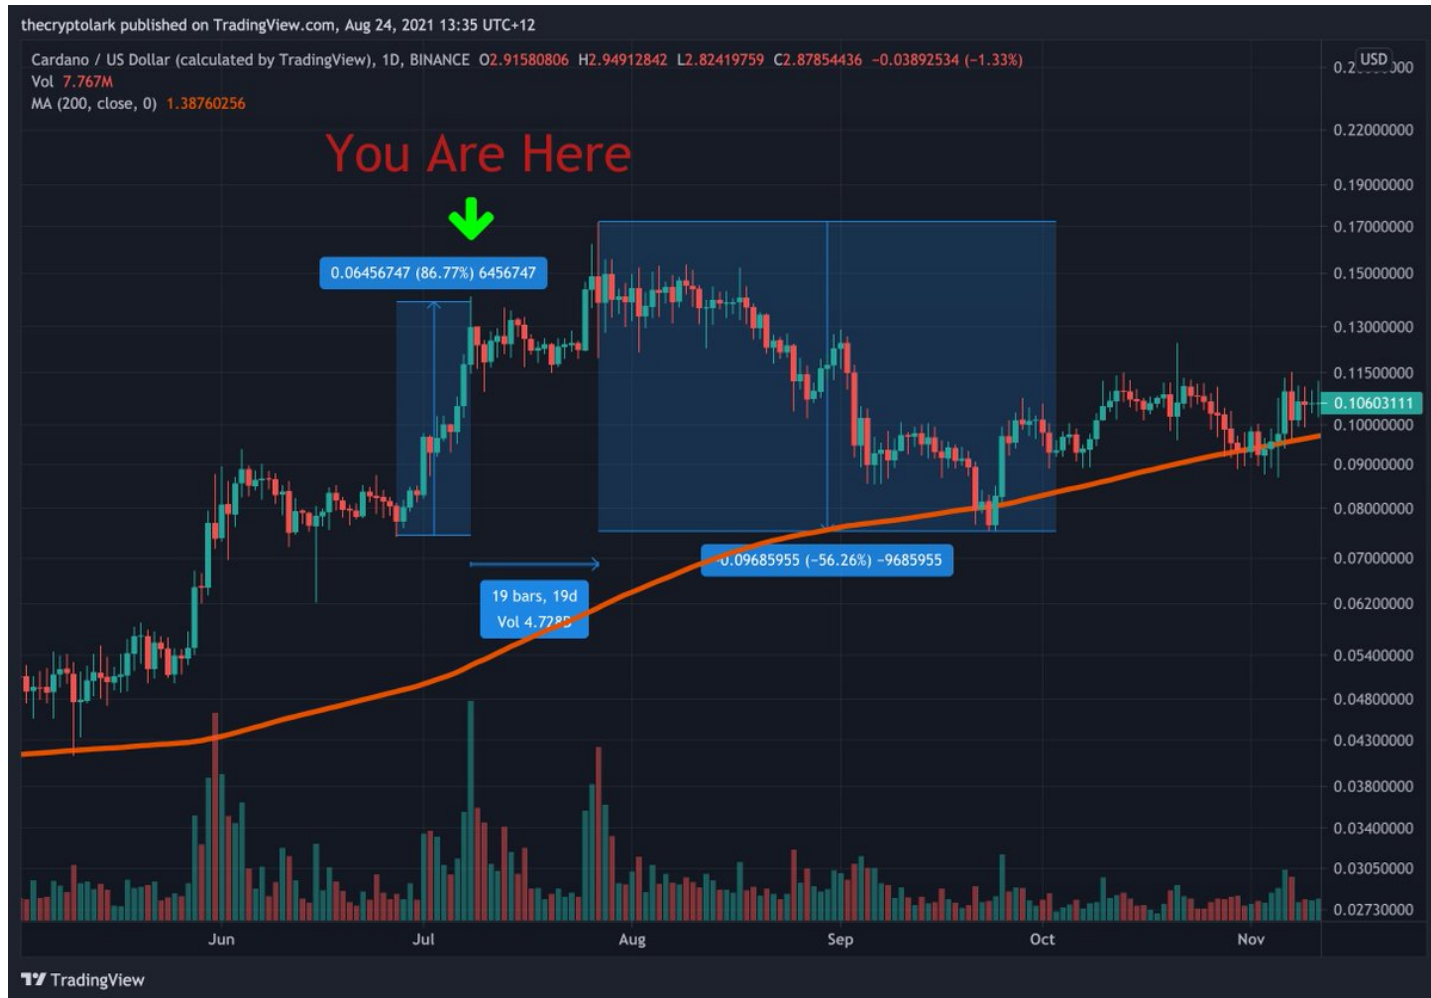

thread

Note that there is a chance we see a pull back when smart contracts launch. "buy the rumor sell the news" effect.

Some don't think this will happen because SCs are too bullish.

Below staking launch chart

Those on 0 ADA could wait to buy, bag holders be ready for turbulence

But that is just a short term event, and you are not reading this thread for better buying opportunities. We are here to talk moon mission.

So what is a realistic price target for Cardano long term, say end of the decade?

Well a 4X pump would put ADA at the same market cap as Ethereum now = \$10 per ADA

10X pump would give ADA same market cap as BTC now = \$28 per ada
