[@YMehta_](#)

#RS is an indicator which helps in finding strong stock or index in the market.

This learning thread would be on

"■■■■■ ■■ ■■■■■■■■■■ ■■■■■■■■■■"

Shared some strategy.

Like■ & Retweet■for wider reach and for more such learning thread in the future.

1/22

Most of us would confuse it with Relative Strength Index (RSI) but Relative Strength is a different indicator.

We have already covered about "Uses of RSI" in below thread■

<https://t.co/oTOrW7joNI>

One can go through this if you haven't.

2/22

#RSI is a common indicator which most of us use in the stock market.

This learning thread would be on

"\U0001d650\U0001d668\U0001d65a\U0001d668 \U0001d664\U0001d65b \U0001d64d\U0001d64e\U0001d644"

Like\U0001f44d & Retweet\U0001f504 for wider reach and for more such learning thread in the future.

Also, an investment strategy is shared using RSI in the end.

Now coming to Relative Strength (RS).

It is basically a strategy used in momentum investing which shows strength or weakness between two asset classes (two stocks, index, commodity).

One can read about this in below link■

<https://t.co/Jb1IH0I90H>

3/22

As of now, I am using this indicator on .@tradingview platform.

It's free and one can add it in their Tradingview account as well, using this link■

<https://t.co/FxCjJFsNOG>

There are multiple variants in this as well. Some traders use multiple time frame RS.

4/22

RS basically compares returns of one stock/index with the returns of benchmark stock/index at a particular time horizon.

Let's say, I want to analyze TCS and Benchmark Index is Nifty.

5/22

TCS gave 13% returns and Nifty gave returns of 10% in 1 month. Then RS would of TCS would be 13%-10% ~ 3% (approximated).

Actual value/forumula be $((1+13\%)/(1+10\%)-1) = 2.7\%$.

This means TCS had outperformed Nifty in one month by 2.7%.

5/22

Let's see how this indicator looks and how it functions.

This is the general inputs for RS.

Two important inputs here are:

1. Comparative Symbol- This means which would be the benchmark index/stock one want's to compare their stock/index.

6/22

Relative Strength

Inputs Style Visibility

Source: close

Comparative Symbol: NSE:NIFTY

Period: 55

☒ Toggle RS color on crossovers

RS TREND

☐ RS Trend, Range: 5

RS MEAN

Defaults Cancel Ok

In Indian stock market, use Nifty as a benchmark as it includes all the major sectors.

2. Period: This is the time horizon over which one wants to compare the strength or weakness.

General period that is used is:

- 55- (3 months)
- 123- (6 months)
- 252 - (1 year)

7/22

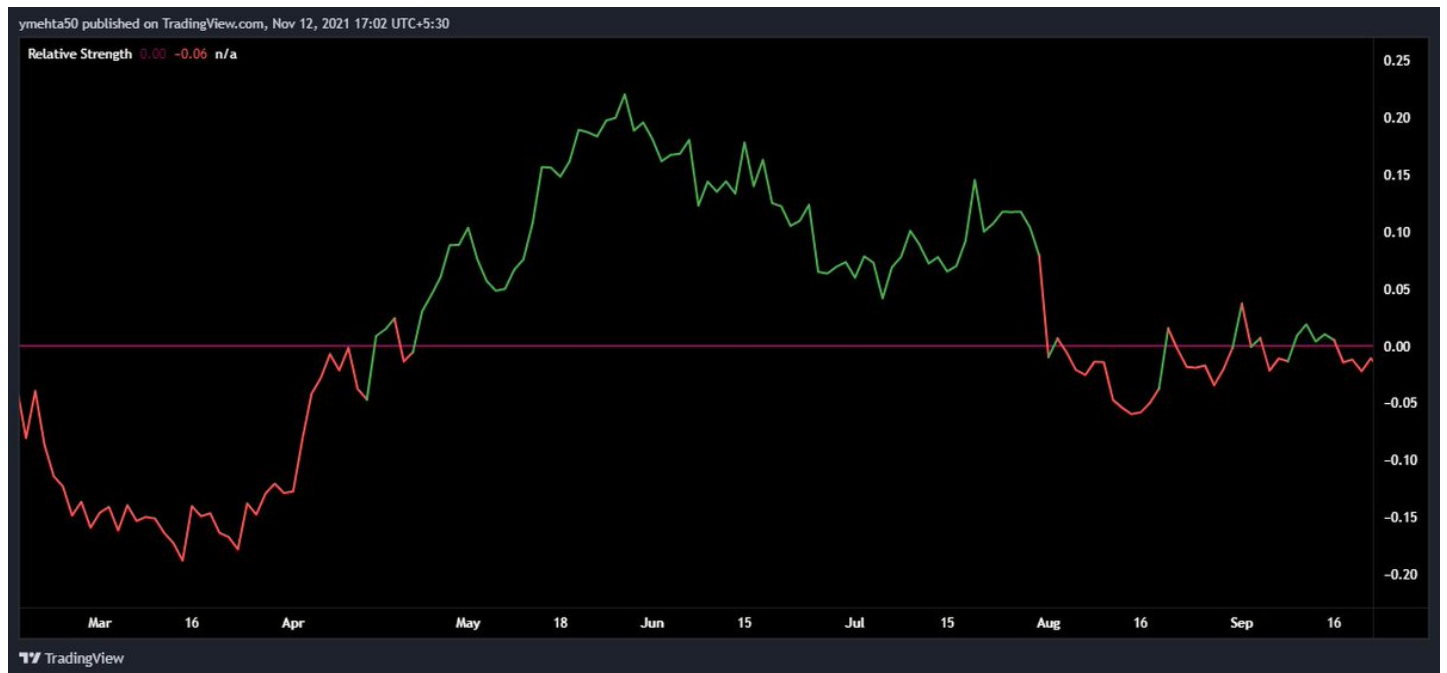

Comparative Symbol and Period are highly customizable and use the values that suit your style.

This is a sample RS chart of Asian Paints v/s Nifty.

Green RS means stock has outperform and Red RS indicates underperformance.

Pink line is 0 line which is highly important.

8/22

General definition of RS says;

If RS line is above 0, then it shows stock will outperform and if RS is below 0, then it shows stock will underperform.

Let's look at the same example:

When RS line closed below 0 line, Asian Paints stock went down from 2600 to 2200 (-15% down).

9/22

Similarly, for bullish setup.

When RS closes above 0 line, price of Asian Paints moved up from 2550 to 3000 (18% up).

Simple Rule of RS is:

1. Buy if $RS > 0$
2. Sell/Exit if $RS < 0$

This looks easy, but this is not that easy.

10/22

Above setup that was shared was only when RS worked well.

There can be a lot of whipsaws in real life and using RS as a standalone will give you a lot of entry and exit in a stock. This will lead to minor loss plus additional trading cost.

What can be done now?

11/22

One of the setup that I am using and practicing based on Relative Strength was gifted by [@vivbajaj](#) sir.

One can watch the video as he had explained everything about simple Relative Strength setup in detail■
<https://t.co/kNpK9M4frd>

12/22

Setup is simple. Use following indicators:

1. Relative Strength (RS) - Period = 55, Benchmark = Nifty
2. Supertrend - Default Setting
3. Relative Strength Index (RSI) - Default Setting

Price Action is used as it is the supreme indicator in trading.

13/22

Buying Setup (Daily Time Frame):

1. RS above 0
2. Price above Supertrend
3. RSI > 50

Once all these conditions satisfy, then wait for price action confirmation.

Price should give a breakout on closing basis above previous swing high with good volumes.

14/22

Exit Setup:

Use 2 hour time frame chart.

If any two of the buying condition gets violated on closing basis, then exit immediately.

Why exit is done based on 2 hour chart?

Reason is fear in market spreads faster, so if lower time frame is bearish then exit.

15/22

Re-enter again if on 2 hours time frame setup becomes bullish and daily setup is also bullish.

Daily and 2 hours combination is for short-term trading.

One can use Weekly and Daily combination for positional trading.

16/22

Let's see some case/examples now:

Infosys (daily chart)

After satisfying all the conditions, entry got triggered at 960 and price rallied from 960 to 1120.

Up by 16% in the short term.

17/22

Second example is Pidilite Industry.

After fulfilling all the conditions, entry got triggered at 1930 and price rallied from 1930 to 2220.

Up by 12% in the short term.

18/22

One example of Positional Trading Setup:

Laurus Lab (Weekly Chart)

All the conditions got satisfied and price moved from 100 to 530. Stock up by 430%.

There would be many examples for this, so I would suggest to check this setup on other stocks and index chart as well.

19/22
