Object Oriented Design patterns to write clean code

C Abstract Factory
S Adapter
S Bridge
C Builder
B Chain of Responsibility
B Command
S Composite
S Decorator
S Facade
C Factory Method
S Flyweight
B Interpreter
B Iterator
B Mediator
B Memento
C Prototype
S Proxy
B Observer
C Singleton
B State
B Strategy
B Template Method
B Visitor

Memento

Type: Behavioral

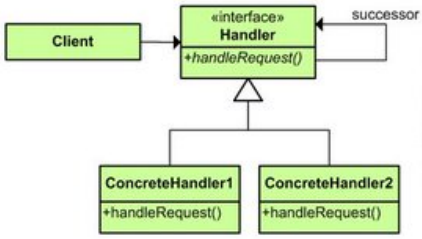

What it is:
Without violating encapsulation, capture and externalize an object's internal state so that the object can be restored to this state later.

Chain of Responsibility

Type: Behavioral

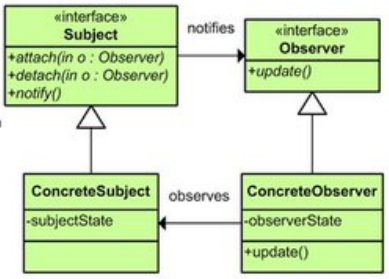

What it is:
Avoid coupling the sender of a request to its receiver by giving more than one object a chance to handle the request. Chain the receiving objects and pass the request along the chain until an object handles it.

Observer

Type: Behavioral

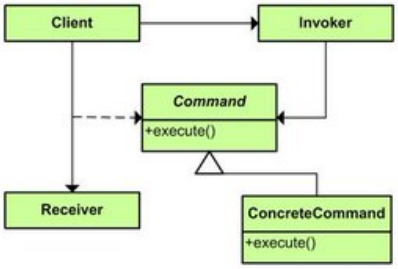

What it is:
Define a one-to-many dependency between objects so that when one object changes state, all its dependents are notified and updated automatically.

Command

Type: Behavioral

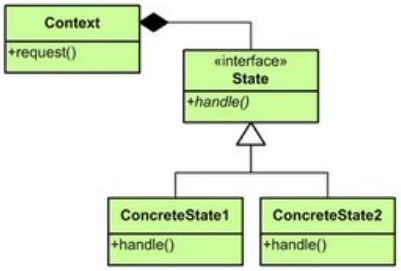

What it is:
Encapsulate a request as an object, thereby letting you parameterize clients with different requests, queue or log requests, and support undoable operations.

State

Type: Behavioral

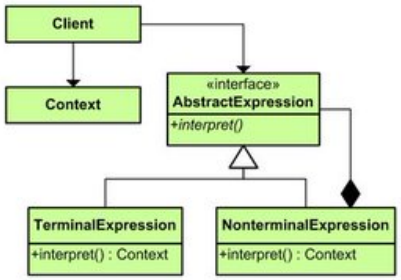

What it is:
Allow an object to alter its behavior when its internal state changes. The object will appear to change its class.

Interpreter

Type: Behavioral

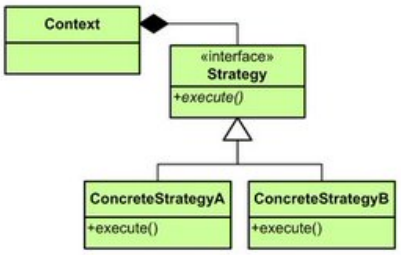

What it is:
Given a language, define a representation for its grammar along with an interpreter that uses the representation to interpret sentences in the language.

Strategy

Type: Behavioral

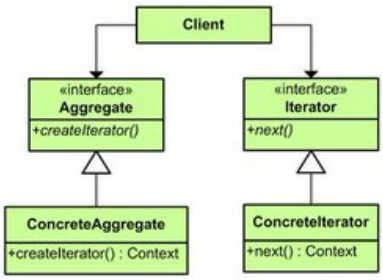

What it is:
Define a family of algorithms, encapsulate each one, and make them interchangeable. Lets the algorithm vary independently from clients that use it.

Iterator

Type: Behavioral

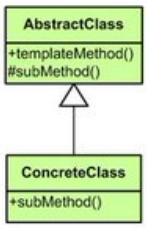

What it is:
Provide a way to access the elements of an aggregate object sequentially without exposing its underlying representation.

Template Method

Type: Behavioral

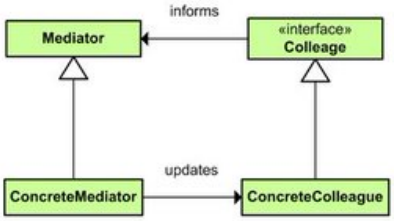

What it is:
Define the skeleton of an algorithm in an operation, deferring some steps to subclasses. Lets subclasses redefine certain steps of an algorithm without changing the algorithm's structure.

Mediator

Type: Behavioral

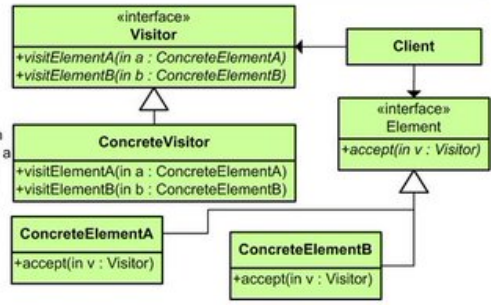

What it is:
Define an object that encapsulates how a set of objects interact. Promotes loose coupling by keeping objects from referring to each other explicitly and it lets you vary their interactions independently.

Visitor

Type: Behavioral

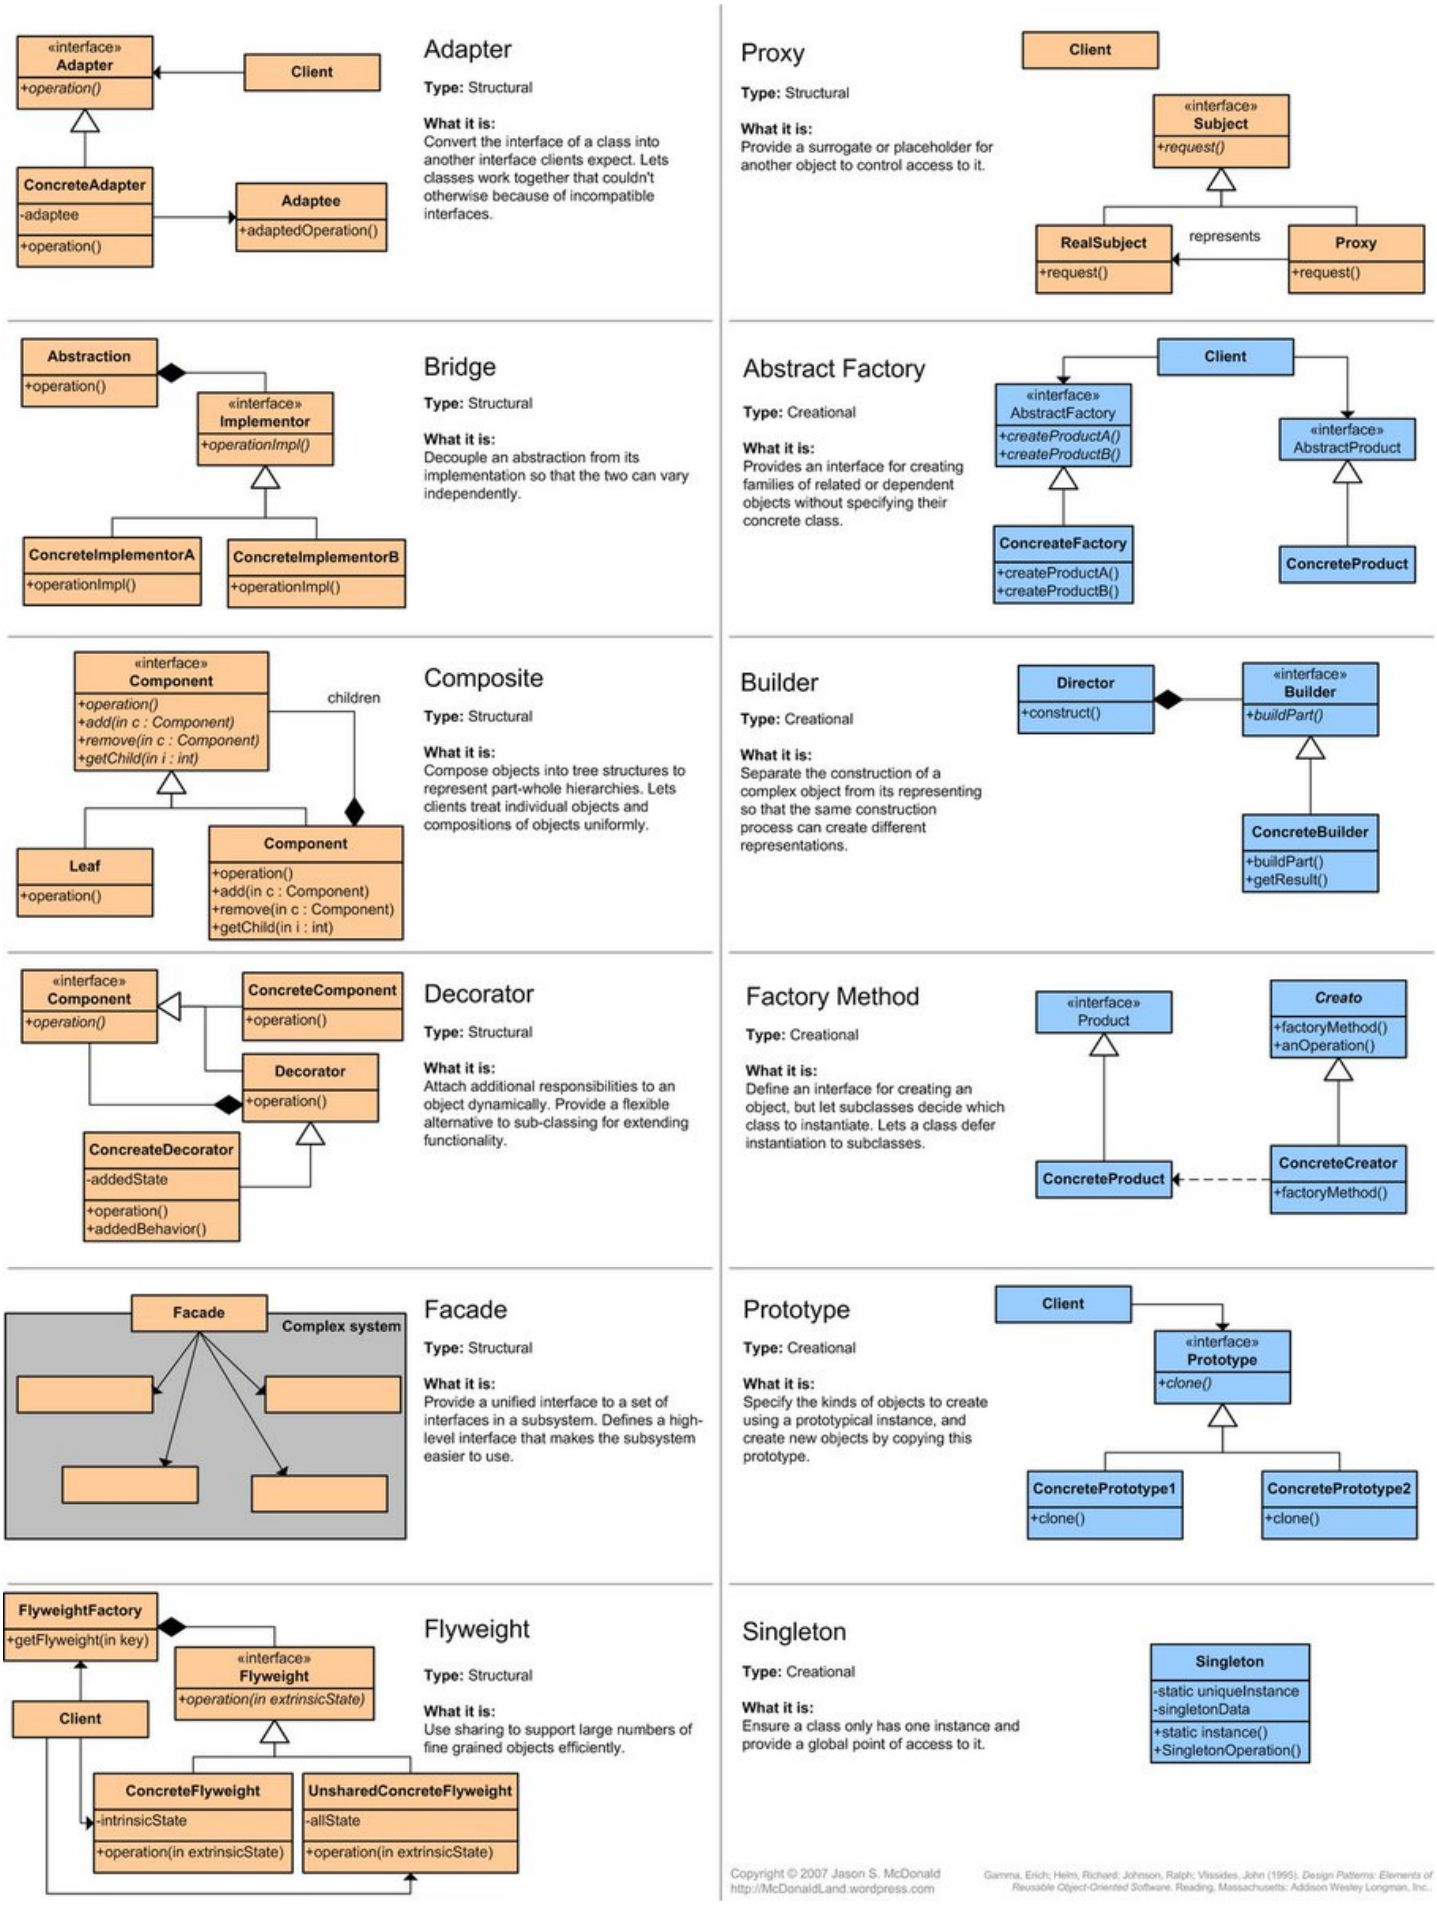

What it is:
Represent an operation to be performed on the elements of an object structure. Lets you define a new operation without changing the classes of the elements on which it operates.
