You may think you know what life will be like in 20 years.

But your brain does not understand exponential change.

Here's what's coming:

The metaverse will become fundamental to everyday existence.

The average person will use the metaverse as much as people use the internet and smartphones today.

It's where you will spend a large part of your work or school day.

In fact, most activities will take place in the metaverse:

- work
- school
- training
- shopping
- entertainment
- fitness and more.

So, what is the metaverse?

It's a combination of technologies that allows an unlimited number of users to experience real-time rendered, 3D virtual worlds synchronously and persistently.

The metaverse explained in 14 minutes by [@ballmatthew](#) ■

A life-like AI assistant will be your day-to-day companion.

Most people will depend on one.

It constantly predicts what you want to do next and makes suggestions throughout the day.

It gives personalized answers to your questions based on your goals, interests, and career paths.

Some people have a therapy or emotional support AI companion that's designed to meet their specific needs.

Like a much more advanced version of Replika ■

The Future of AI Is Personal by [@mikewalsh](#)

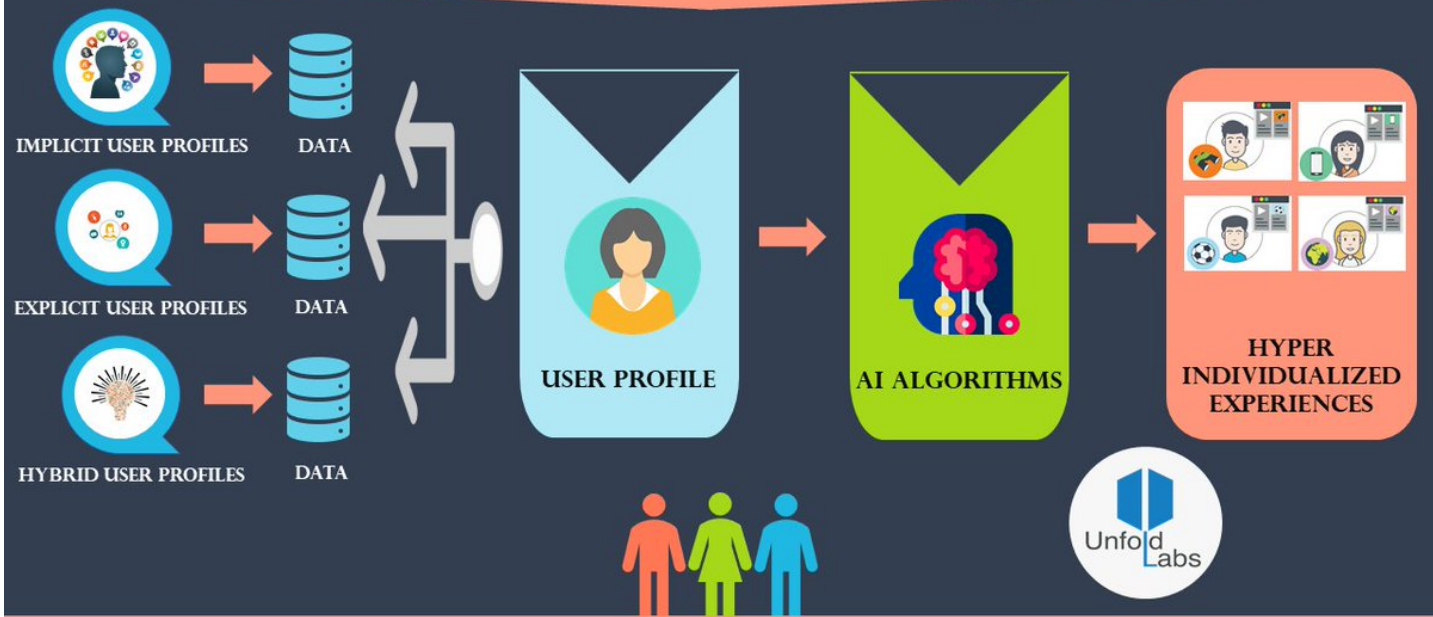

<https://t.co/Uw9nOATq9i>

Artificial Intelligence will take over education.

AI teachers will provide personalized education for all students.

Classes and courses will be designed
based on the student's interests, inclinations and goals.

ARTIFICIAL INTELLIGENCE (AI) BOOSTED PERSONALIZATION

AI teachers will dramatically lower all basic costs in the educational system and allow hundreds of millions more to access free, high-quality education.

Human teachers will act as personal mentors, coaches and guides.

AI: The Good

sciforce

Here are some of the ways AI positively impacts education:

- optimizes learning experiences for each student

- can be adapted to student's unique needs
- can track student's progress and adapt accordingly

The entertainment industry will be entirely transformed.

The current studio system will no longer exist.

Instead, a series of decentralized organizations and communities will create and distribute film and TV productions.

These communities will control narratives, storylines, character development, casting, distribution and more.

Power will be removed from the big production companies and distributed among filmmakers, talent and fans.

The result:

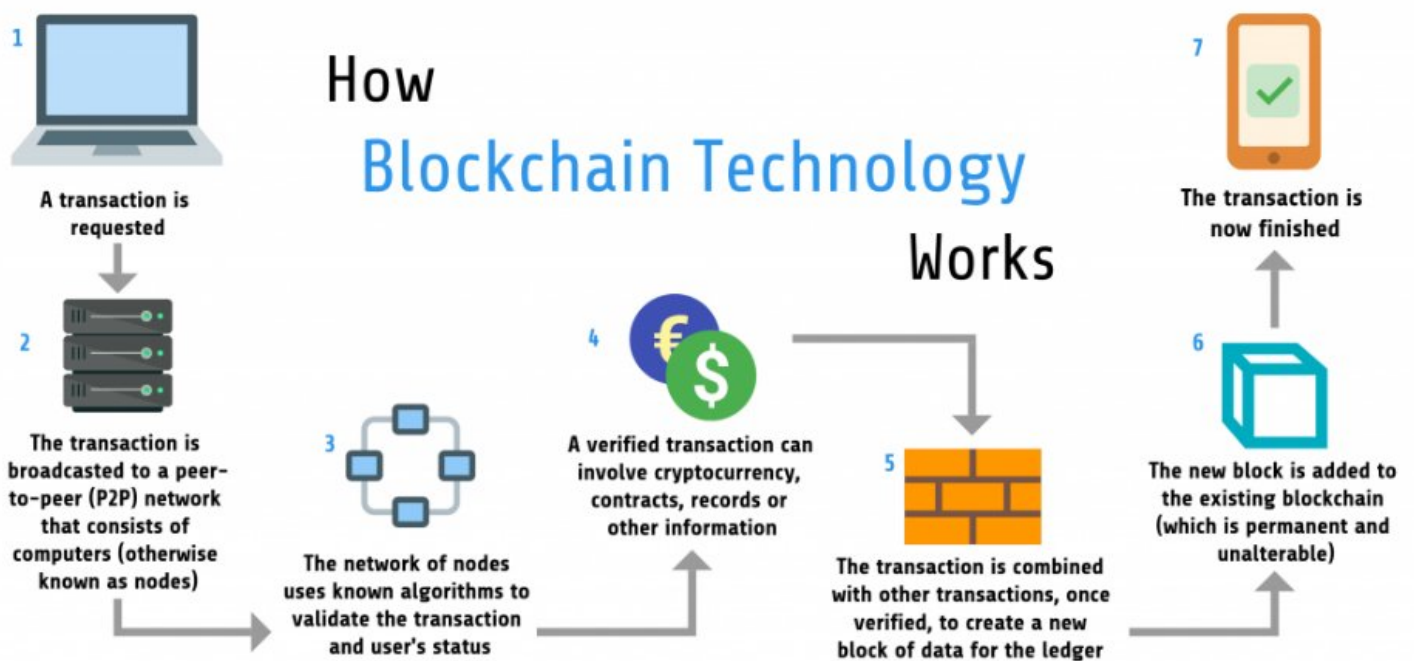

- many more higher quality stories are told
- much larger audiences are served
- the box office is off the charts

- creatives are properly compensated
- fandoms and fan fiction are respected and rewarded, and more.

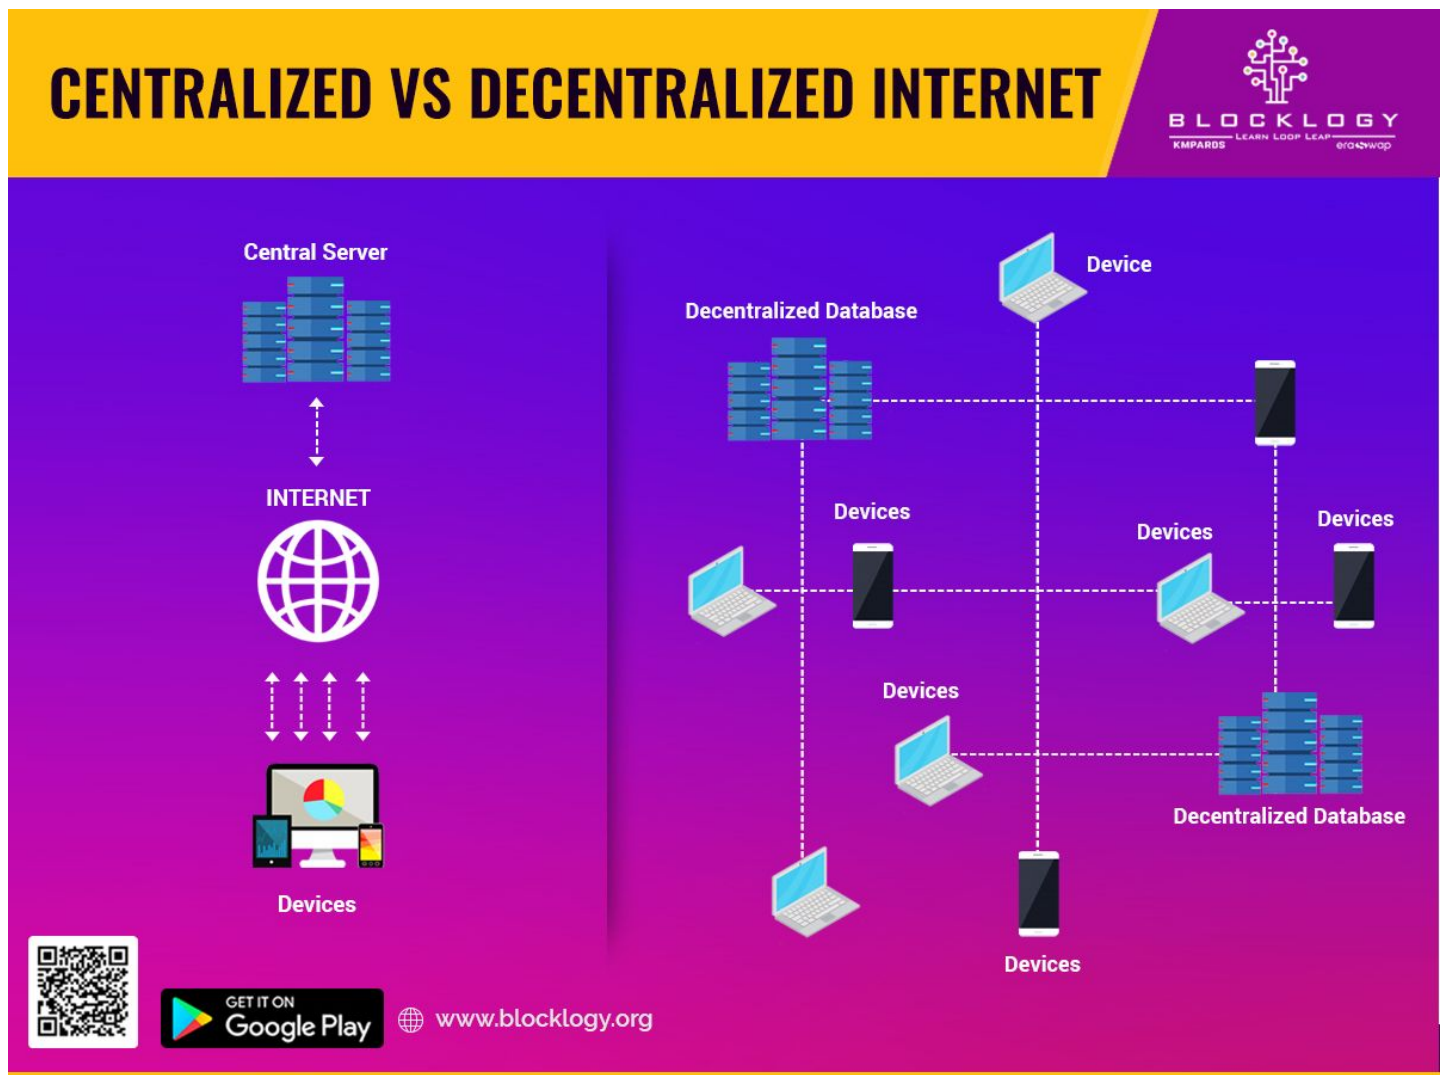

99% of digital transactions will be on the blockchain.

It becomes a bedrock of society like electricity and the internet are today.

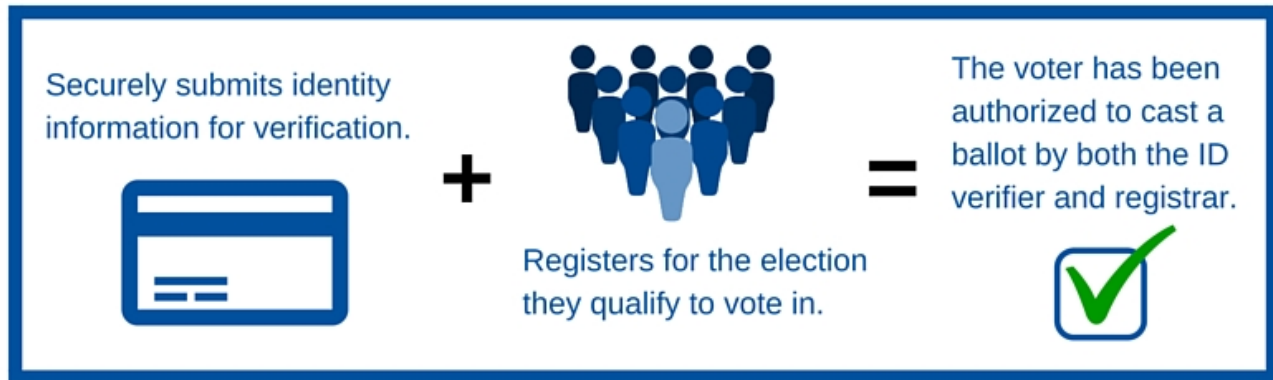

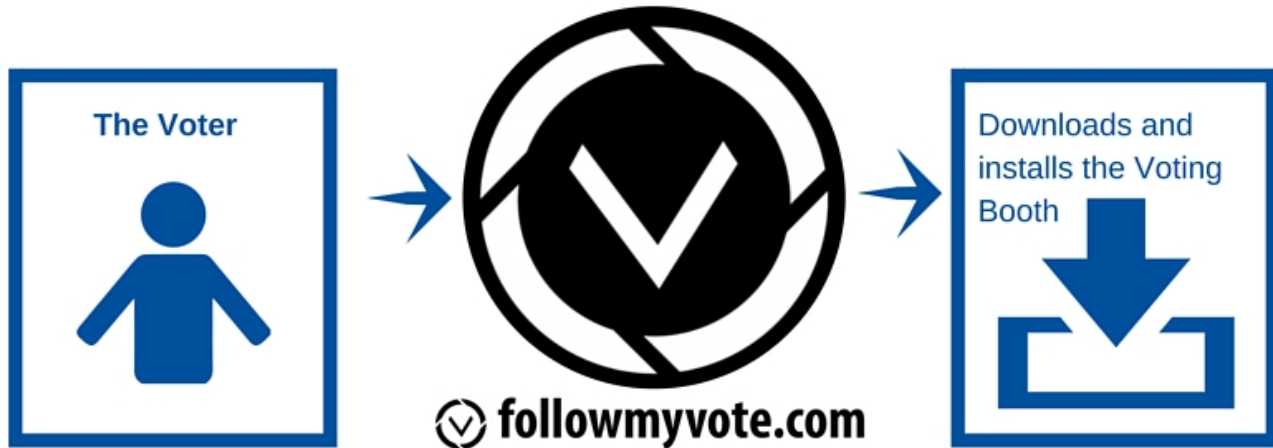

You will own your online identity and content, and your activity will be private.

The blockchain will make elections more secure and transparent by assigning an id to each voter and easily keeping track of those votes.

Blockchain Voting

THE FOLLOW MY VOTE WAY

The voter then votes and submits their ballot to a secure blockchain based ballot box, while retaining anonymity and ballot secrecy.

If a voter changes their mind, they have the ability to change their vote at anytime in the days leading up to the election.

(Election officials can decide to turn off or on this capability depending on laws and election rules)

Using their vote account, the voter can go into the ballot box and verify for themselves that their vote was cast as intended. The Voter can even audit each ballot in the ballot box to confirm the election results are accurate. All while retaining privacy and top level security.

But what is the metaverse?

Why is it important? And how will it fit into and perhaps shape our society in the years and decades to come?
