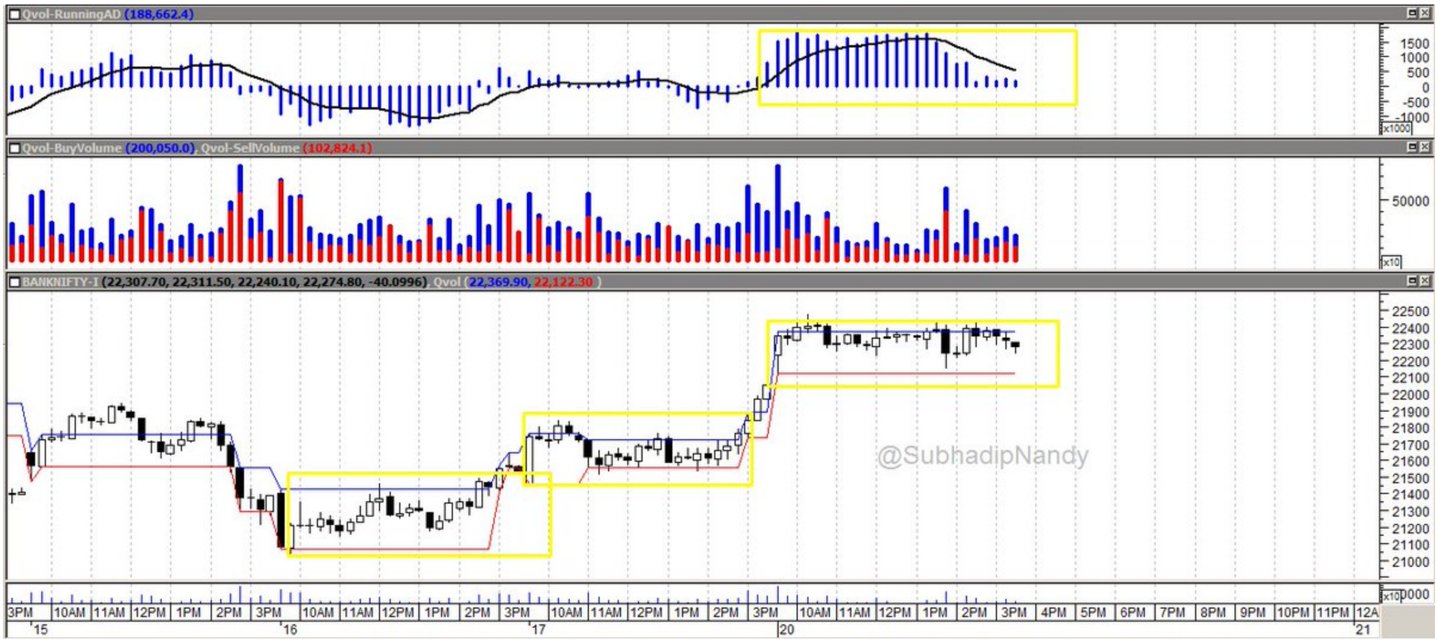
Nifty fut : rising Lows and Highs, showing a megaphone or broadening formation on 15 min charts. Though a bearish pattern, here it seems has broken out. 11k CEs on monthlies seems badly trapped. As long as the CE is > 140, will maintain a strong bullish stance

EOD charts. Rising after strong accumulation and volumes. COI going up with rise in price. Can have a fast upmove anytime now till 11300. View negated below 10900

BNF 15 min charts : showing FLAG formation. Breakout above 22400, trade negated below 22200. Targets given in chart. Also higher highs and higher lows

BNF also strong accumulation yesterday. This model is also showing continuous accumulation since 16th. Almost same levels given in earlier tweet



Now there are broad positional views, or the context. Trades now will be based on realtime data , option analysis etc. But these analysis suggests keeping a bullish bias on the indices while trading now unless this data changes drastically

These moves, if they happen will also have high volatility like yesterday. As I have told many times earlier " higher the volatility, lower the volume and bigger the stoploss" . Keep this in mind while trading
