The Story of the Cooperation with Mother Nature in the Garden of Eden was transformed into the Story of his Cruel Father Sky, Anu, who moved the Humans Out the Garden.

Me-Sin implemented a Religious System based on his own Rules.

The narrative of the Sky had to be a “rotating” cyclic narrative because the sky was in constant cyclic motion. Ancient tradition states that heavenly locations had earthly counterparts (“As Above, so Below“).

Megaliths (“giant standing stones“, “menhirs“) and related constructions such as cairns and dolmens (chambers of stone), tumuli and barrows (ancient earthworks) and henges and circles were built by ancient man for purposes of Astronomy and Geodetics.

Anyone having knowledge of the heavenly stars could thus find his way around on Earth by means of the megaliths, which served both as boundaries and landmarks.

Many megaliths are carved with reliefs of interlocking figures (smaller figures drawn within larger figures) which identify the stars to which stones are oriented.

Many standing stones have cupmarks or less formal indentations or holes on them marking the stars or stellar constellations which they represent.

Additional markings on some stones identify parameters such as ecliptic, celestial equator, circle of precession, center of heaven (north ecliptic pole, south ecliptic pole), north pole star, south pole star, cord of the fish, Milky Way and solstice and equinox points.

Many cairns or quoits are in the shape of the star groups they represent. Megalithic boundaries mark both small and large geographic areas. For example, Counties in Scotland still retain elements of the approximate size, shape,

& location of their comparable stellar constellations, located on earth by megaliths. Perthshire in Scotland e.g. retains the name PERSeus in PERTH. The 7 Churches of Asia are oriented to the Seven Stars of the Pleiades.

The shape of many stones shows the appropriate part of the heavens explicitly. Ancient earthworks also served astronomical purposes. Tumuli & barrows mark specific stars or nebulae. Earthwork mounds may form the shape of a celestial object, e.g. the Large Magellanic Cloud.

Geographic locations of megaliths were intentionally oriented to the stars & to objects of the heavens in a given era. For Neolithic sites, the cardinal date seems to be the Winter Solstice in 3117 BC.

The circumference of the earth varies because the Noble & Beautiful Planet is Egg shaped. The distance is different depending on where one makes a measurement.

When we measure the Earth in Egypt the number 26,400 miles appears which is the Amount of Years the Precession of the Equinox takes.

A mile in distance upon the earth equals one year of precession, & one degree of distance on the earth, a 360th part of the circumference equals 72 years of Precession of Equinox.

The ancient Scientists not only created a highly advanced Navigation System & a Calendar, they also Mapped this System to a Metric System of Earth. This System was just like the Calendar &the Navigation System implemented all over the world.

The ancient Scientists observed many Cycles & detected the relationship between the Cycles & the Numbers. With help of the knowledge of the Cycles they could predict the Future (Kronos).

To Rule the World you have anticipate the Future.

One of most important Cycles is called the Etanic Cycle. In a 780 year period the earth wobbles above the equator to a max of (4) degrees, then wobbles back below the equator to a max of (4) degrees. The full cycle take 1560 years.

The 1560 year wobble can be broken down into the four quadrants of 390 years, & to the Mayan Calendar eighth part of 130 years. The constant movement by Earth above & below the equator shifts the exposure of different areas of the planet to annual sun light.

It also generates a lot of Tectonic Stress (Earthquakes/Storms) from the planet’s core to its surface. The Etanic Cycle has a huge influence on the Climate. Climate changes shift populations of humans & herds all around the Globe.

To Rule the World you have to know when the Big Troubles are Coming.

The year 3117 BC was a special year not only because of the special alignment of Sun & Earth. There are 5280 Feet to the Mile. This number is one fifth of the duration of the Precession Cycle.

The periodicity of the well-known Economic Kondratiev Cycle is 5280/100=52.8 years.
