Twitter Thread by Void■

I have been writing software for over a decade.

My 5 best advices for developers

that will save you 1000+ hours (■):

■■ On writing code

Solve the problem *before* writing code.

Clear code >>>> Clever code

Always optimize code for readability

and THEN efficiency (if required)

Remember:

You are not bad at coding. You just need more practice.

■■ On debugging code

Code doesn't do what you expect

it does what you tell it to do.

Be ready to spend hours bridging the gap.

When debugging:

- Pay attention to error messages
- Use debuggers
- Ask for help when stuck

Prefer refactoring buggy code
over adding new code.
■■On testing code
Developers today are expected to:
write software quickly
without shipping bugs
Know that some tests are more important than the others.
Now that some tests are more important than the others.
Start with ad-hoc tests
Dut use test suterestion as much as possible
But use test automation as much as possible.
Test less. But smarter.
■■ On writing documentation
Good code is self-documenting
Good code is self-documenting but you should document tradeoffs
but you should document tradeoffs
but you should document tradeoffs and decisions of your code. Some tips:
but you should document tradeoffs and decisions of your code. Some tips: • Automate doc generation
but you should document tradeoffs and decisions of your code. Some tips: • Automate doc generation • Document just enough
but you should document tradeoffs and decisions of your code. Some tips: • Automate doc generation
but you should document tradeoffs and decisions of your code. Some tips: • Automate doc generation • Document just enough
but you should document tradeoffs and decisions of your code. Some tips: • Automate doc generation • Document just enough • Use tests as documentation
but you should document tradeoffs and decisions of your code. Some tips: Automate doc generation Document just enough Use tests as documentation Just remember that no documentation >> incorrect documentation
but you should document tradeoffs and decisions of your code. Some tips: • Automate doc generation • Document just enough • Use tests as documentation Just remember that
but you should document tradeoffs and decisions of your code. Some tips: Automate doc generation Document just enough Use tests as documentation Just remember that no documentation >> incorrect documentation
but you should document tradeoffs and decisions of your code. Some tips: • Automate doc generation • Document just enough • Use tests as documentation Just remember that no documentation >> incorrect documentation

Avoid reviewing large code changes.

Establish a process. Use checklists.

See code reviews as a form of

knowledge sharing.

Learn from feedback.

TL;DR

- On writing code
- On debugging code
- On testing code
- On writing documentation
- On code reviews

That's it!
