SCB has dropped its final 2020 stats on deaths for Sweden. This chart is a breakdown by age for both sexes compared to 2018.

Most notably, there's no excess among children and people of working age, confirming the preliminary stats for males I had published earlier.

Here's the same data, but with spline interpolation applied to the 5-yr age groups. This just smooths out some of the random and cohort-related fluctuations. The picture is the same.

Unfortunately, the fact deaths are exclusively concentrated in the elderly age rage means that all of the deaths you see reported are pretty much all theirs. Fortunately, since they're generally retired, they don't need to sacrifice their livelihoods to protect themselves.

We need evidence-based mitigation strategies. Terrorizing a 15yo with imminent death is neither helpful nor honest. Closing schools isn't helpful (and Sweden hasn't). Be aware around your (grand)parents. Take care of them, make sure they understand the risks.

With the resources we have spent/lost on locking down people below 75 years old, I'm sure we could have devised a far superior targeted approach for those who need it and request it. We don't need to demolish our society, economy, and the lives of future generations to save lives
