Inflation is coming, inflation is coming!

Last month I wrote about the distinction between long-term secular inflation and shorter-term cyclical inflation

It has been clear for several months that we are in the middle of a cyclical rise in

Now, in the short-term, the manufacturing sector is red hot, driven by a pent-up demand rebound in goods consumption.

Commodity prices are screaming which gives legs to "goods" inflation in the short-term.

2/

Consensus continues to conflate the inflation story, mixing and matching long-term and short-term charts to fit what is generally a secular inflation narrative.

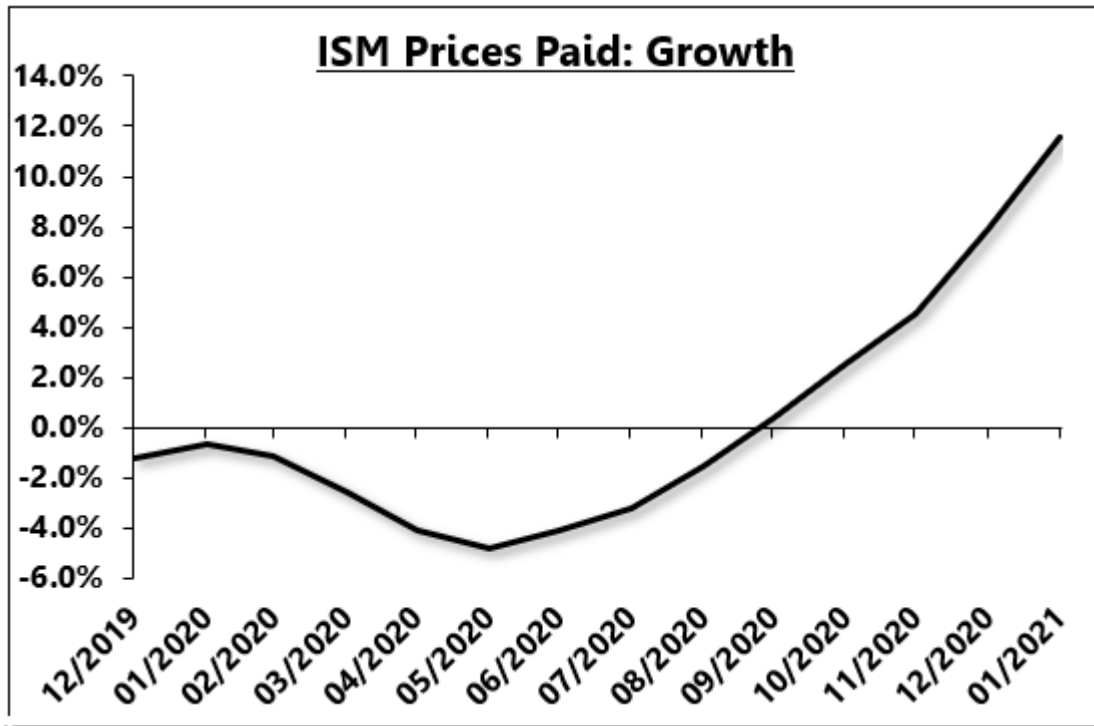

Here are my two cents to make the distinction clear.

Today's PPI report should have been expected to surprise to the upside as the leading indicators of inflation have been screaming to the upside for months!

Here is the ISM prices paid index, cumulated into a growth rate

Industrial commodity prices have also seen a major acceleration for months.

So today's PPI report was in line with the leads, suggesting that we have a cyclical upturn in inflation that is * primarily concentrated in the manufacturing sector *

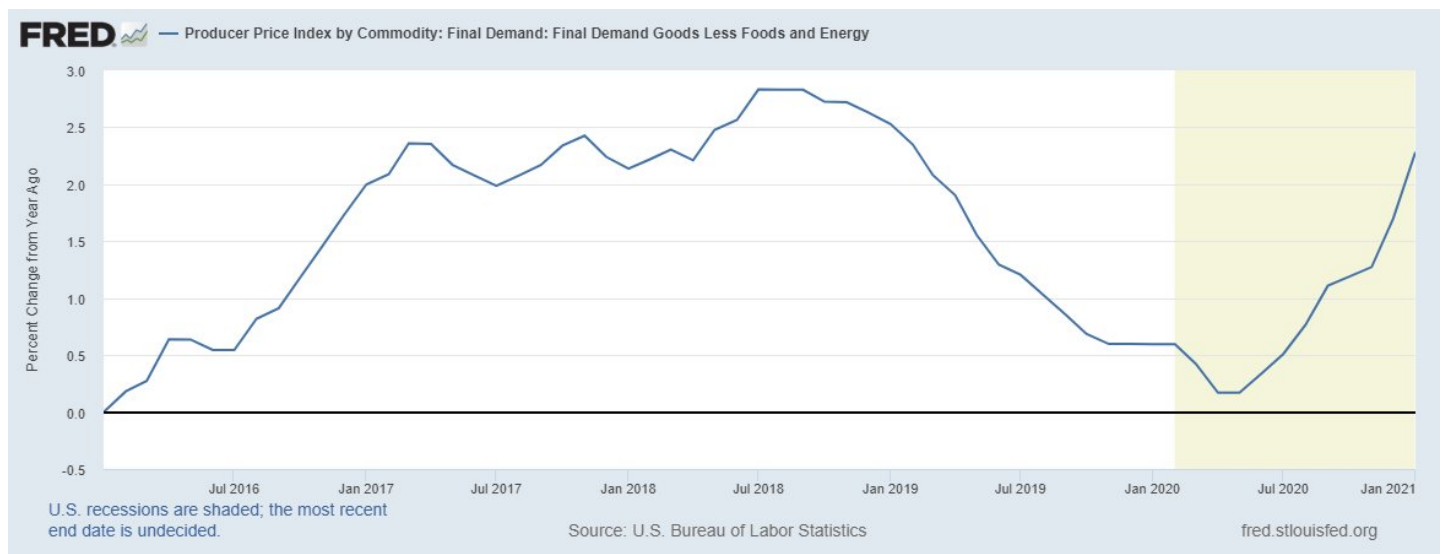

This is a key point.

5/

Core PPI showed an increase in year over year terms to nearly 2.5%.

6/

To be very clear, this cyclical upturn in inflation will continue for the next several months and should not be expected to fall apart imminently

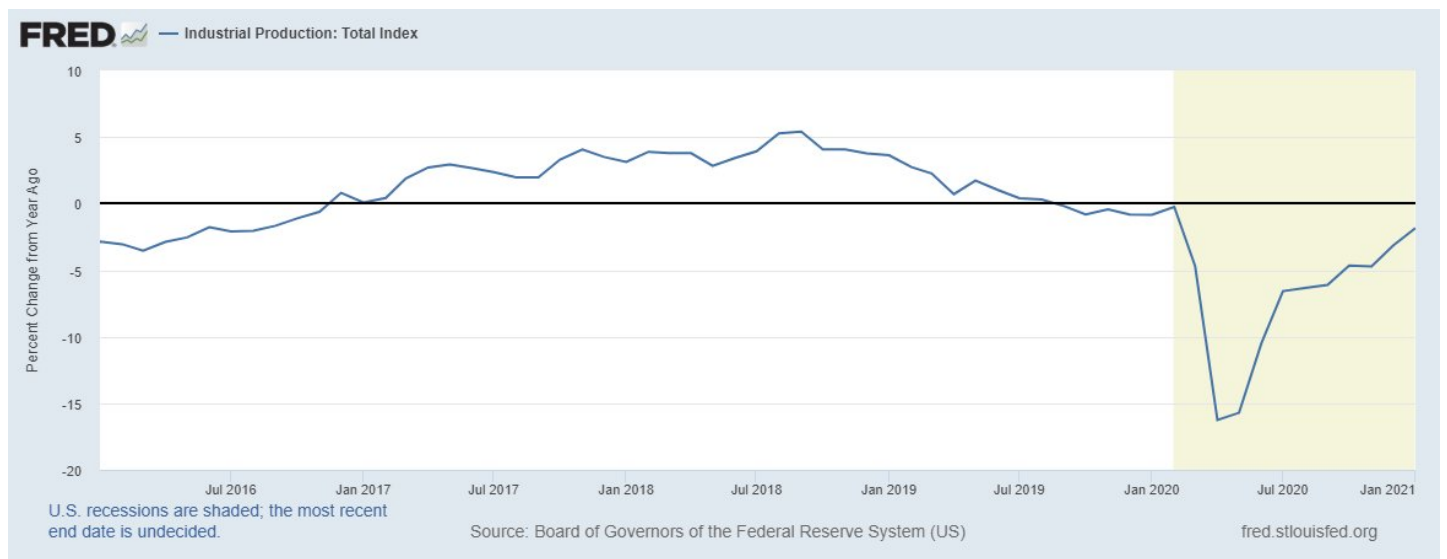

This does not mean the secular disinflationary trend is over. We have had 4-5 of these upturns since 2010. They happen. They fade

7/

Sticking with the trend of a general manufacturing-based upturn, what else surprised to the upside (shouldn't have been a surprise)...industrial production.

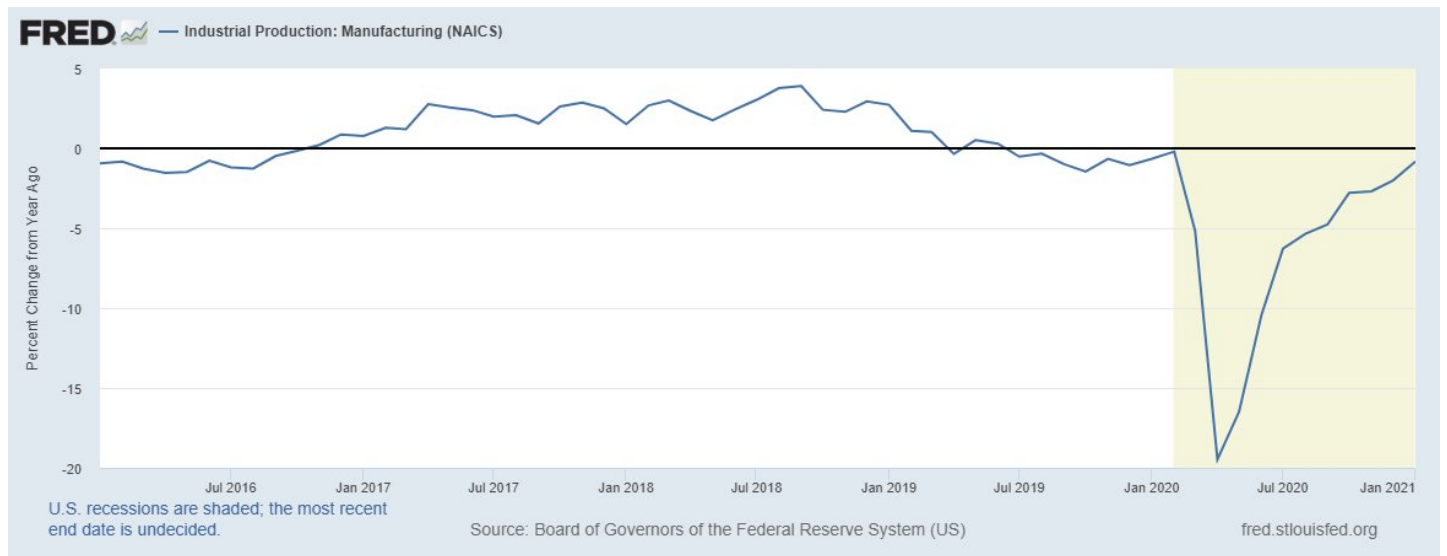

IP growth increased to -1.83% y/y

8/

Industrial production for manufacturing specifically is almost back to positive growth on a year over year basis.

9/

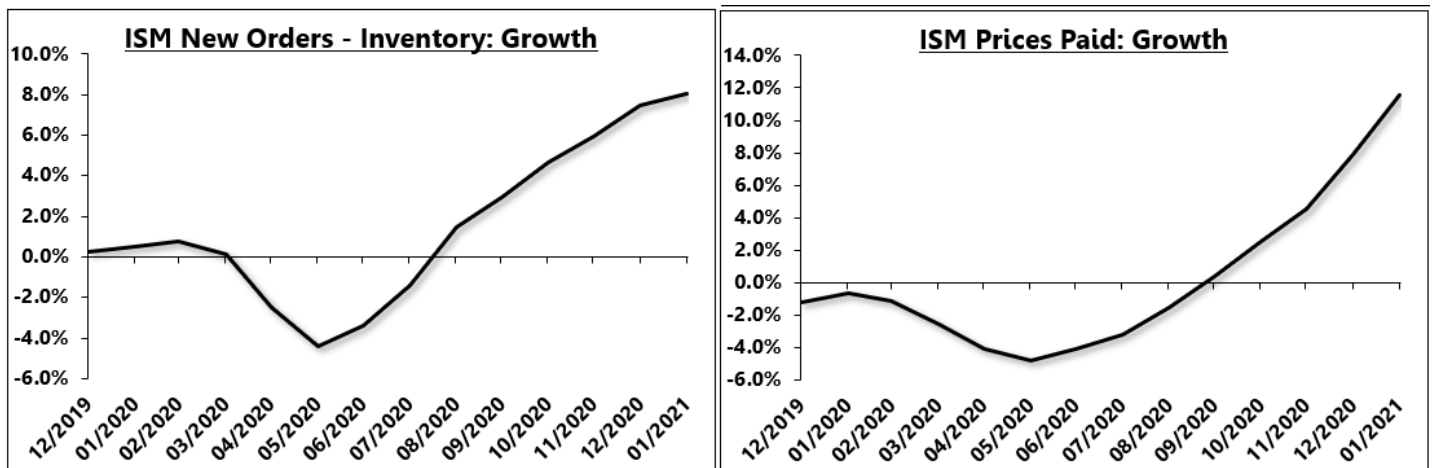

Should we expect the manufacturing-based growth and inflation upturn to continue?

Yes.

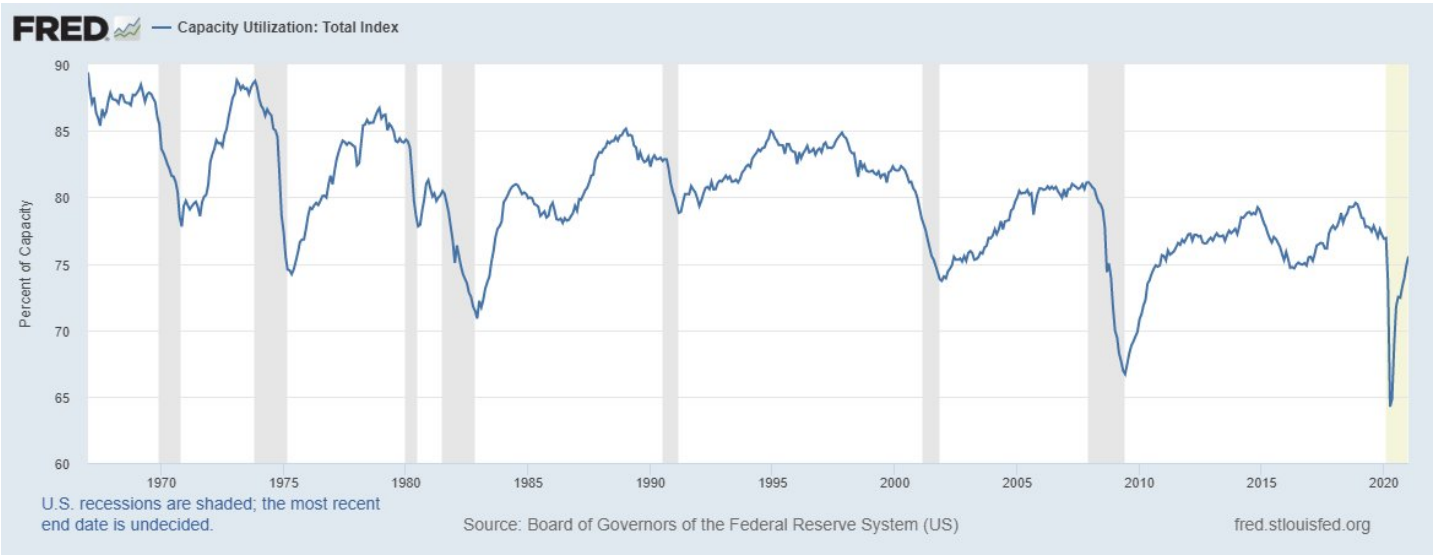

But remember to differentiate cyclical for secular.

10/

We're not changing this trend anytime soon.

11/

TLDR:

Play the cyclical trend. Don't lose sight of the long-term fundamentals.
