The excellent ECB Financial Stability Review, <https://t.co/k8HcqpryDF> illustrates well the 2 main risks I see for the EA economy next year: possible insufficient fiscal stimulus and weakening of bank credit supply. The FSR mentions “a slightly tighter fiscal stance” in 2021 1/

The FSR correct statement “fiscal tightening at a time when output gaps are still projected to be negative could exacerbate the current economic situation.”, caused some stir and many comments in social media. The same regarding the accompanying chart 2/

Fiscal stance and output gap across countries

(x-axis: output gap as a percentage of GDP; y-axis: change in cyclically adjusted primary budget balance as a percentage of GDP; dots represent countries)

The FSR uses the Commission forecasts showing a slight increase of the cyclically-adjusted primary budget balance from -3.2% this year to -2.9% in 2021. 0.3% is a small change not comparable with the mistake of 2012/13 when it went from -0.6% in 2011 to +0.5 & +1.4 in 2012/13 3/

I think the primary balance will end-up higher than those forecasts because families and firms will continue to need a lot of support in the first half of the year. Moreover, growth in 2021 is dependent on public expenditure as other demand components will not be very buoyant. 4/

As the FSR says: "A premature withdrawal of policy support and a protracted pandemic could prolong the recession and have permanent scarring effects." Besides extending income transfers to families and firms, more public investment is indispensable for a robust recovery 5/

Regarding banks, their problem is lack of profitability, low stock prices abysmal Price-to-Book ratios (chart). Consequently difficulty in raising capital in the market when more will be necessary to absorb further losses from bad loans later on. 6/

Evolution of banks' price-to-book ratios

(left graph: 1 Feb.-17 Nov. 2020, ratio; right graph: 17 Nov. 2020, ratio)

More loan losses impacting capital are coming this year, with Governments discontinuing guarantees. The FSR reminds: "Bank capital buffers should remain available to absorb losses for an extended period, and any impediments to banks using buffers should be addressed" 7/

However, the releasable buffers are small and either the markets or the supervisors apparently won't condone big reductions of capital ratios (see chart). In this case, the end result might be deleveraging and a reduction of credit growth with negative economic consequences 8/

Chart 5.2

Capital relief measures helped to prevent a procyclical rise in bank capital targets

That means that capital and not liquidity will be the operative constraint to credit supply. Still, it will be appropriate to extend TLTRO III allotments until the end of the year, to provide some stimulus to credit supply, especially induced by the rate bonification in place 9/

Bank stocks suffered again this year despite the overall boost provided by monetary policy. This decomposition of stock valuations shows the positive contributions of lower discount rates and dividend/buybacks offsetting the negative effect of earnings and the equity premium 10/

Chart 2.4

Heterogeneous performance in equity markets reflects different earnings prospects

Euro area equity price index decomposition

(4 Jan. 2019-13 Nov. 2020, percentages)

Monetary policy improved the Financial Conditions Index to easing levels above the pre-pandemic times (chart), but this refers only to creating incentives for economic agents increasing real expenditures, which cannot happen significantly in this type of crisis 11/

Chart 2.1

Financial conditions ease and investor sentiment turns in favour of the euro

Decomposition of financial conditions in advanced economies

(1 Jan. 2019-17 Nov. 2020, index)

Euro net speculative positioning and risk reversal

(2 Jan. 2019-17 Nov. 2020, number of contracts and difference in volatility points)

Sources: Refinitiv, Bloomberg Finance L.P., Commodity Futures Trading Commission (CFTC) and ECB calculations.

As the indirect incentives of Monetary policy are showing diminishing returns, only fiscal stimulus in the form of public expenditure with income transfers and investment creates real demand for goods and services to offset the deceleration of private spending. 12/12
