**The Cantillon Effect is the most important economic concept you've never heard of.**

**Here's a breakdown of what it is (and why you should care):**

1/ Richard Cantillon was an Irish-French economist and philosopher born in the 1680s.

He achieved success as a banker—which he attributed to the formidable connections made through his family and employer.

At a young age, he had learned of the impact of proximity to power...

2/ Around 1730, Cantillon wrote a paper—*Essay on the Nature of Commerce in General*—which is considered a foundational work in the study of the political economy.

It was widely circulated in manuscript form, though it was not published until 1755, well after his death.

3/ In the paper, Cantillon posited that the early recipients of new money entering an economy will benefit more significantly than those it trickles down to.

In other words, the "flow path" of the new money matters!

4/ In 18th century terms, those closest to the King—the source of money/power—benefitted first when new money entered the economy.

Broadly, Cantillon observed that new money creates distributional effects based on where it enters the system.

The Cantillon Effect was born...

5/ Let's use a (very) simple story to illustrate Cantillon's central point:

Imagine you live in a tiny, enclosed island society.

One morning, you wake up to find a package on your doorstep.

You open it up and see that it has \$1 million in it.

Great! But now what?

6/ No one else knows you received this package.

You now secretly have \$1 million new dollars.

Naturally, you start spending it (and maybe investing it) quickly.

Prices are still low, because no one knows these new dollars exist yet!

Your standard of living improves rapidly.

7/ You buy yourself the nicest house, the most beautiful clothes, a bunch of land—and still have some money left over.

But now, people see and feel this new money flowing through the system.

Prices begin to rise as supply has yet to "catch up" to the new demand. It takes time.

8/ So while the money improved your life, it didn't benefit others in the same way.

The sellers of the goods—who received your cash—now face rising prices when they consume.

Same with the workers who produced the goods.

There were distributional effects—the flow path mattered!

9/ This is—quite obviously—an ultra-simplified example, but it gets at the essence of the problem that Cantillon highlighted.

Proximity to the source of new money is relevant—the entry point and flow path have distributional consequences.

So why should you care today?

10/ Well, with the "money printing" activity of central banks globally and an expanding wealth inequality problem, mentions of the Cantillon Effect have accelerated.

It's a useful lens through which to evaluate the monetary and fiscal response to COVID—and its potential impact.

11/ Here's a (very!) simple view of what I see:

The Federal Reserve's escalating asset purchases have an injection point at the top.

Direct stimulus checks—on the other hand—have an injection point at the bottom.

The former was much larger \$\$\$ than the latter.

12/ The asset purchases—and rock-bottom interest rates, among other things—generally benefit asset owners (the wealthy).

Those with a significant portion of their net worth in equities, real estate, or similar assets have benefitted significantly over the last 18 months.

13/ Wage earners—who received some degree of support but did not benefit in the same way from the asset appreciation—are getting the short end of the stick.

Inflation—particularly across food and energy prices—will have a disproportionate impact on their standard of living.

## U.S. % after-tax income spent on gasoline, by income decile

14/ By now, everyone has heard that inflation is running hot in the U.S.

But perhaps more importantly, it's also running disproportionately hot—as exhibited in this chart from [@Business](#) this week.

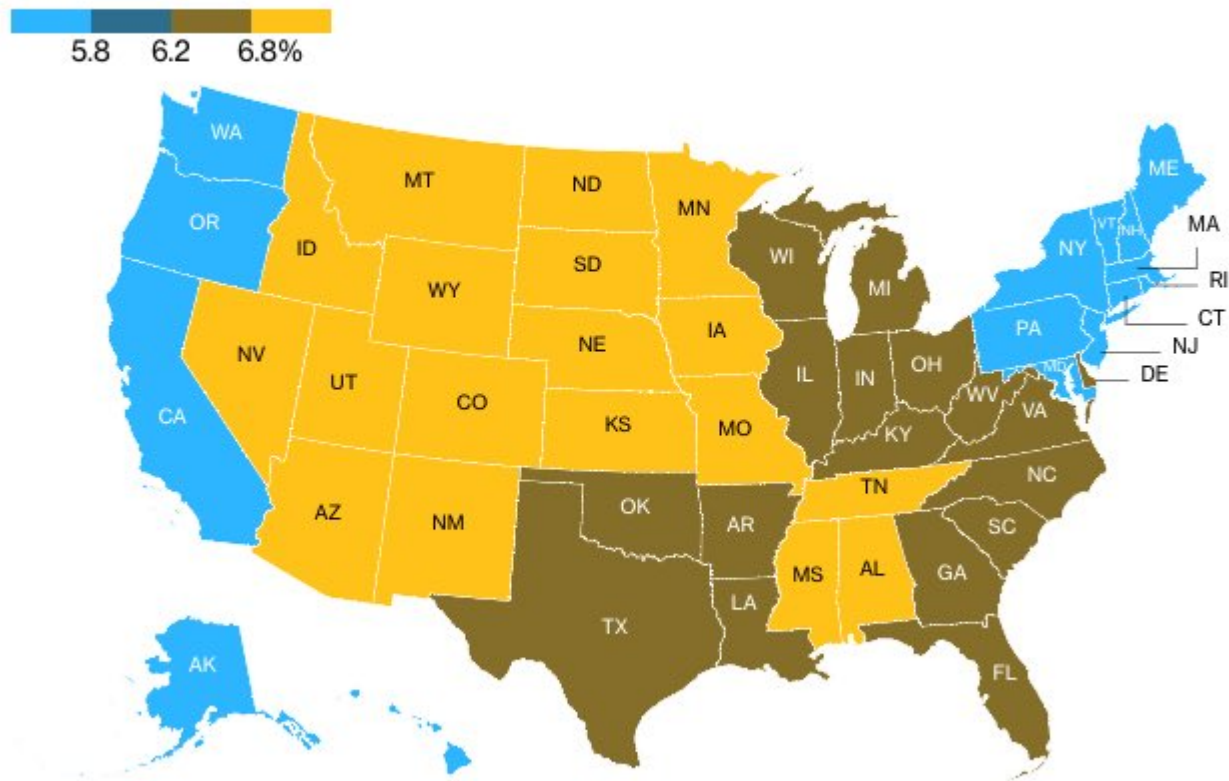

So what do you think? Was Cantillon right?

And what can we do about it?

## Price Pressures Across the U.S.

Inflation is most tepid along the coasts, highest in Midwest and South

Source: Bureau of Labor Statistics

15/ I hope this short thread provides you with a solid foundation of understanding on the topic.

This should not be a political debate.

It should be a grounded discussion we all have when we consider the impact of various monetary and fiscal policies proposed by our leaders.

16/ I've personally been using [@Kalshi](#) and its monthly inflation markets to track sentiment around inflation. It's worth checking out (for the data, or as a portfolio hedge!).

The November market is below.

# Spotlight

**Christmas may look a little different** this year for struggling U.S. families.

- **Why:** Higher prices are coupling with a withdrawal of pandemic support to strain wallets.
- **What that means:** More than 11% of Americans will spend nothing for the holidays, the most in at least a decade and more than double the number in 2020, a Deloitte survey showed.
- **Knock-on effects:** Deeper inequality. Households making more than \$150,000 a year will spend almost double the average in the upcoming season, PwC said.
