## **Twitter Thread by Steve Nison**

A general guide to position sizing for beginners. There is nothing new which I am sharing. Everything is already in the public domain or many books elsewhere.

## Position sizing for beginners

Two basic Jules:

1. No more than 1% risk per trade. (1% of your total capital).

2. No more than 10% allocation in a single position.

## Example:

Laurus Lass current price to buy @ 690 Stop Lass Level: 620/-Difference => 70/-

Total capital => 5,00,000 ₹

Risk por trade > 1% of total capital => 5,000 ₹

Therefore, quantity to be bought

⇒ 5,000 ₹ = 71 Shares.

Total capital deployed => 71 shore × 690\$

which is less than 10% of total postfolio value.

If position per trade coming out to be more than 10% => reduce the quantity accordingly.
