It's the weekend!

Grab a cup of coffee, in this thread I will explain

1. What is a Yield Curve?
2. Why is it an important indicator of Recession?
3. Is an Economic Recession around the corner?

Lets dive right in!

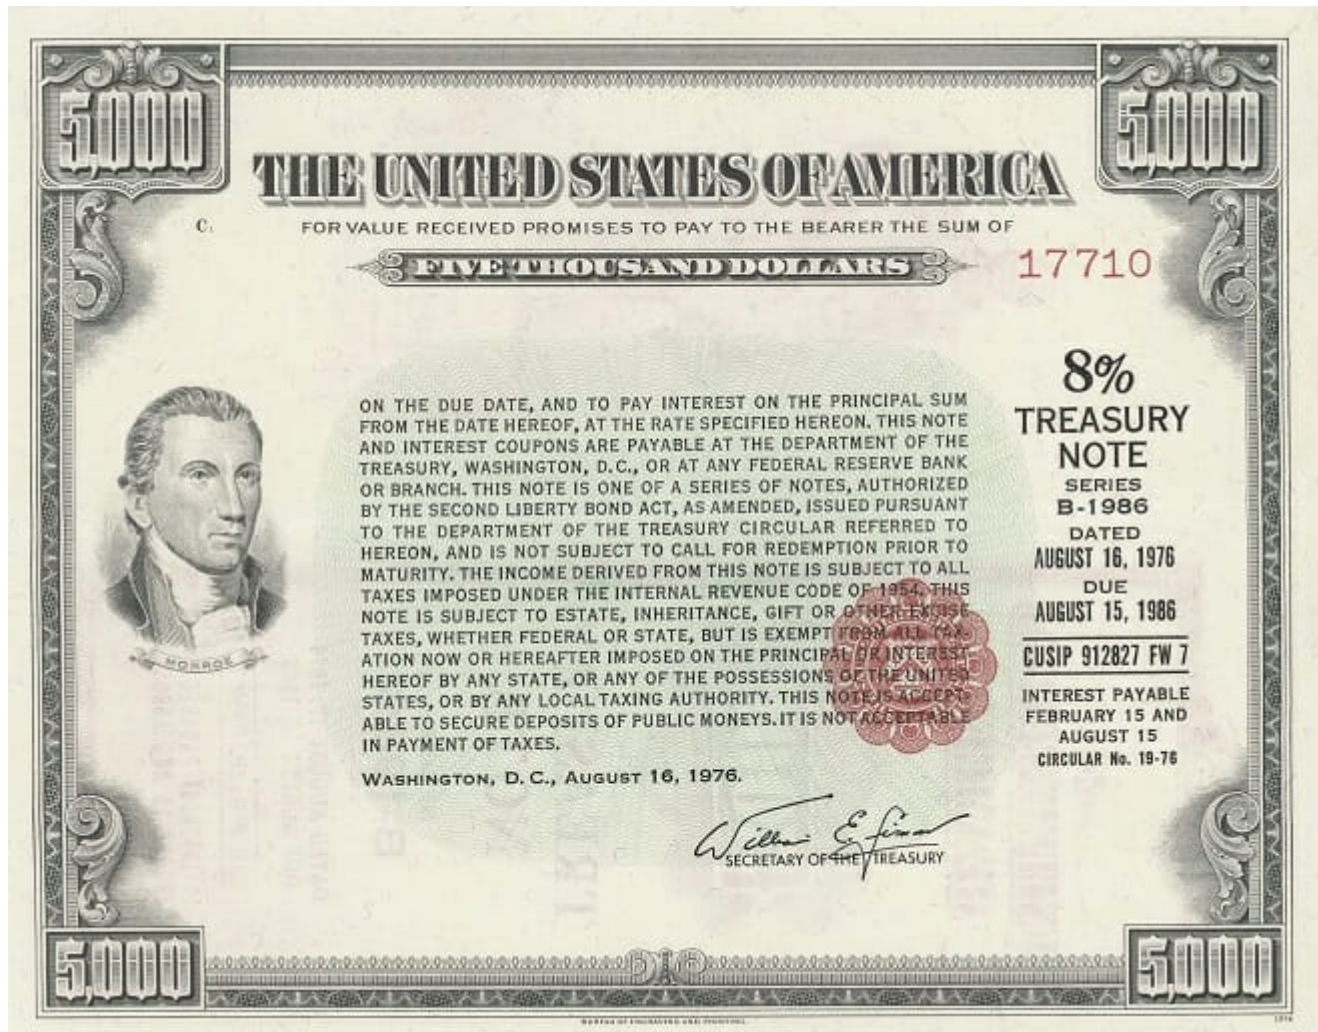

Before we understand a Yield Curve, lets get some of the basic terminology out of the way

1. What is a Bond?

A bond is a fixed income financial instrument which represents a loan made by an investor to a borrower

The investor typically receives payment in the form of interest and a lumpsum (principal) on maturity

The interest rate on a bond is known as coupon rate.

There are many types of bonds like

1. Zero Coupon : Pays both interest and principal at maturity
2. Sovereign Bonds : Issued by a Government or a Quasi Government Institution
3. Corporate Bonds : Issued by corporate like banks, established companies etc.

Types of Bonds

Coupon (Interest Rates) on a bond are decided based on the issuer's credit rating

The higher the credit worthiness of the issuer, the lower the coupon rate

Credit Rating on a Bond is usually assigned by credit rating agencies like Moody's or Standard & Poor's (S&P)

**HIGH CREDIT RATINGS
LOW COUPON PAYMENTS**

**LOW CREDIT RATINGS
HIGH COUPON PAYMENTS**

US Treasury Bonds are always assigned a rating of AAA (Triple A) as they are backed by the Government and are considered default free

Anything with a credit rating of BBB (Triple B) or lower is considered as 'junk bond' or a 'high yield bond' as they have high risk of default

Bond Rating		Grade	Risk
Moody's	Standard & Poor's		
Aaa	AAA	Investment	Lowest Risk
Aa	AA	Investment	Low Risk
A	A	Investment	Low Risk
Baa	BBB	Investment	Medium Risk
Ba, B	BB, B	Junk	High Risk
Caa/Ca/C	CCC/CC/C	Junk	Highest Risk
C	D	Junk	In Default

2. What is Yield?

Yield is simply the return an investor of a bond realizes over the course of the bond holding period

Formula for calculation of a Bond Yield

$\text{Bond Yield} = \text{Interest Payments} / \text{Bond Price}$

Since, coupon (interest) payments on a bond along with tenure of a bond is fixed

your yield on a bond simply depends on the change in its price

Current Yield of Bond Formula

$$\text{Current Yield} = \frac{\text{Annual Coupon Payment}}{\text{Current Market Price of Bond}}$$

Let me explain this concept with an example of a Dividend Yield (easier to relate to)

The logic and concept followed for calculation and estimating a Dividend Yield can be directly applied to a bond yield as well.

Take for example, Dividend Yield calculation of ITC

ITC as per its policy issues out 85% of its profits as Dividends to its Shareholders, this comes to around ~Rs 10/share

When ITC was trading

at 180/share, the Div. Yield was 5.5%

at 254/share, Div. Yield is 3.93%

In the above calculation, the dividend didn't change but because the price in denominator of our formula changed, it led to a change in Dividend Yield

If Bond Prices go up, the Yield on the bond will decrease

If Bond Price come down, the Yield on the bond will increase

Just like stock prices, bond prices keep on changing depending on economy, Central Bank interest rates, demand + supply etc.

3. What is a Yield to Maturity?

Suppose if you buy a 10 year Govt Bond that pays 5% interest yearly for Rs 1000

If instead of selling the bond when bond price rises to Rs 1100, you held on to your bond until its maturity date till end of 10 years

The present value of all the coupon (interest) payments that you will receive on the bond along with the principal repayment at the end of 10 years, is called Yield to Maturity.

$$\text{Yield to maturity} = \left(\frac{\text{Face value}}{\text{Current bond price}} \right) \left(\frac{1}{\text{Years to maturity}} \right) - 1$$

 Investopedia

You can learn more about the concept of present value at the below link <https://t.co/G8TvhDjKDh>

4. What is Yield Curve?

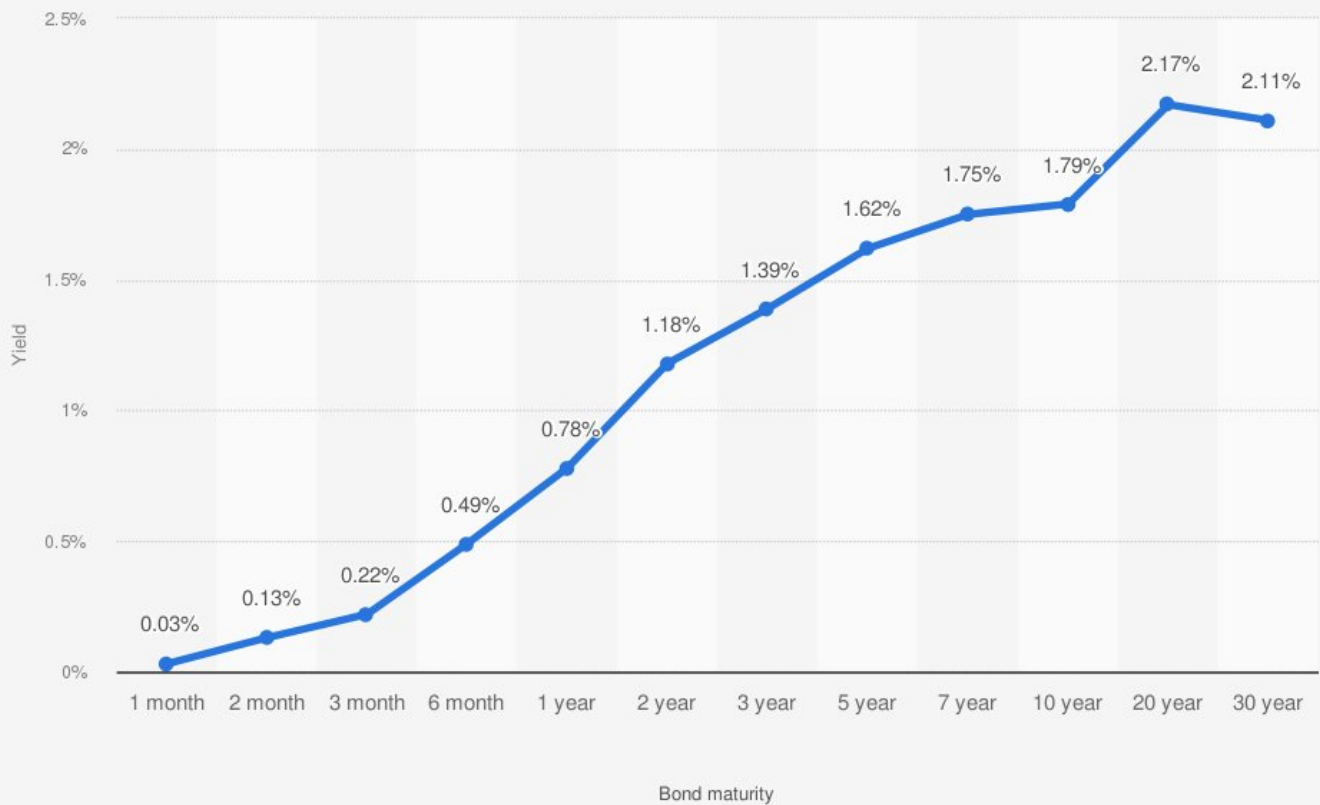

A Yield Curve is just a graphical representation of Yields of various bonds with similar credit rating but differing maturities

When the media talks about a Yield Curve, they are primarily talking about the US Treasury Yield Curve

which depicts the Bond Yields on US Treasury Bonds for varying maturity dates ranging from 1 Month to 30 Years

Treasury yield curve in the United States as of January 31, 2022

Additional Information:
United States; January 31, 2022

So now that you have understood the basics, lets try and answer a burning question

Why is Yield Curve used to predict a Recession?

Yield Curve are typically of three types:

- a. Upwards Sloping (Most of the Time)
- b. Flat (Rare)
- c. Inverted Yield Curve (Very Rare)

The shape of the Yield Curve is dependent on a simple logic

Yields on longer term bonds should be much higher compared to Yields on shorter term bonds

as

with longer term bonds you are taking more risk and hence need more interest as return

As such in a normal economic environment, we have upwards sloping Yield Curves like shown below

Inverted Yield Curves happen when yields on short term bonds rise above Yields on Long Term Bonds

implying that near term risk in the economy is higher compared to long term

Because near term economy is considered risky

Bond Investors start dumping their short term bonds in favour for longer duration bonds

As such

Demand for Short Term Bonds decreases, causing Bond Prices to collapse and Yields to Increase

While

Demand for Longer Term Bonds Increases, causing Bond Prices to rise and Yields to Decrease

Thus, creating the inverted Yield Curve.

Inverted Yield Curves are an excellent tool to predict upcoming Recessions as per US Federal Reserve

Here are some of their publications on this subject

Why Does the Yield-Curve Slope Predict Recessions?¹

By [Luca Benzoni](#), [Olena Chyruk](#), [David Kelley](#)

An Inverted Yield Curve has successfully predicted every recession since 1957

It even inverted right before the pandemic!

Typically an economic recession follows after 7 to 24 months since the Yield Curve Inversion

Most recently the US Treasury 2 and 10 yr Yield Curve Inverted on 29th March 2022

imply the onset of a recession anytime between end of 2022 to 2024.

MARKET INSIDER

2-year Treasury yield tops 10-year rate, a 'yield curve' inversion that could signal a recession

This brings me to the last Question of this thread

IS AN ECONOMIC RECSSION AROUND THE CORNER?

Short Answer : Nobody knows

All Economies, work on a Peak to Trough cycle and as much as Expansions are part of the Economic Cycle, so are Recessions

Without Recessions, we wouldn't have the opportunity to reset and economy would overheat and turn into a bubble which when popped could bring depression.

Economic Cycle

For a Recession to happen, you need several ingredients

1. Slowing Economic Growth
2. High Unemployment Rate
3. High to Medium Fed Interest Rates

None of the characteristics today satisfy the onset of a Recession

For example,

US last week reported the lowest joblessness since 1969!

US weekly jobless claims drop to lowest since 1969

The United States job market continues to show strength even as prices surge.

World Economic Growth isn't slowing down

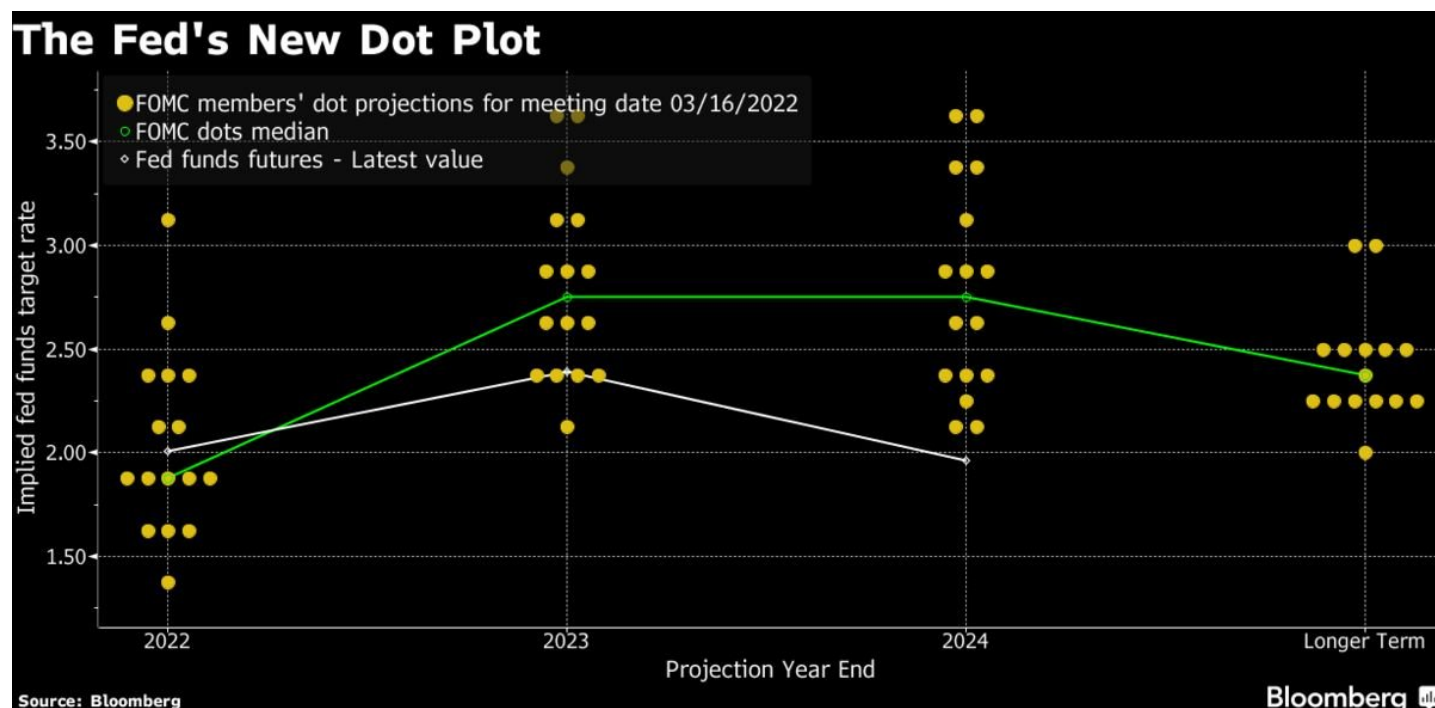

Latest World Economic Outlook Growth Projections

	ESTIMATE	PROJECTIONS	
(real GDP, annual percent change)	2021	2022	2023
World Output	5.9	4.4	3.8
Advanced Economies	5.0	3.9	2.6
United States	5.6	4.0	2.6
Euro Area	5.2	3.9	2.5
Germany	2.7	3.8	2.5
France	6.7	3.5	1.8
Italy	6.2	3.8	2.2
Spain	4.9	5.8	3.8
Japan	1.6	3.3	1.8
United Kingdom	7.2	4.7	2.3
Canada	4.7	4.1	2.8
Other Advanced Economies	4.7	3.6	2.9

Memorandum			
Emerging Market and Middle-Income Economies	6.8	4.8	4.6
Low-Income Developing Countries	3.1	5.3	5.5

Source: IMF, *World Economic Outlook Update*, January 2022

Note: For India, data and forecasts are presented on a fiscal year basis, with FY 2021/2022 starting in April 2021. For the January 2022 WEO Update, India's growth projections are 8.7 percent in 2022 and 6.6 percent in 2023 based on calendar year. For India the impact of the Omicron variant is captured in the column for 2021 in the table.

And Fed Interest Rates are at the bottom they have ever been with the only option for Fed to Increase them and not decrease them as they would to prevent a recession

Inflation is rampant throughout the world today but that inflation is not caused by lack or overdemand in the economy (as it would during a peak of an economic cycle)

The inflation today is purely a result of supply side shortages caused by the onset of the pandemic

Cost-Push, or Supply-Side Inflation

- **Stagflation** occurs when output is falling at the same time that prices are rising.
- One possible cause of stagflation is an increase in costs.

Considering all of the above, will we face a recession as predicted by the Yield Curve?

I don't know and I am not sure if anybody does.

Thank you for reading!

I hope you've found this thread helpful. Follow me [@itsTarH](#) for more.
