Cultured Meat

Laurus Bio helps cultured meat companies reduce dependency and eliminate animal derived serum and media components such as Fetal Bovine Serum (FBS)

Unlike pharmaceutical-grade versions, our food-grade versions of growth factors and recombinant proteins cater to the unique cell-culture media requirements of the cultured meat industry. Combining economies of scale, product, and process innovation, our food-grade versions are being developed to meet the cost structure and large, industrial-scale requirements of the industry.

With deep expertise in protein design and engineering, recombinant technology, and large-scale precision fermentation-based manufacturing, Laurus Bio is the partner of choice for the cultured meat industry.
