How to trade in options during high volatility i.e. India vix>22-23 ?

In the current scenario, option sellers who are deploying strangles are unable to make money

E.g.: If a trader is selling a strangle of Rs. 100 each leg then during a fast momentum on either side, one leg becomes 80 & the other one Rs. 200

So overall, the strangle seller is at a loss

Strangles & Straddles are easy to manage in low vix

During high vix, find reversals

Mitesh Sir follows 3min TF in Bank nifty futures chart

Specimen:

In a down trending market people are tempted to sell CE & avoid selling PE's, however it would be disastrous to hold those CE's till expiry

Trailing is the answer during high VIX, as the momentum is faster on both sides

Check past few days charts on 3min TF for more clarity

How to find reversals?

Whenever market breaks a support, check the volumes in the downfall

If you intend to catch a trend, then volume is the best indicator for trading, rest all indicators like RSI, MA's etc. are lagging

indicators as they indicate post the movement in price

Hence, volume can be used as a leading indicator

Whenever volumes are declining when prices are making fresh lows, it indicates that the participants are not interested in fresh/further selling for the current period (in intra)

For reversal you just need to take the decision basis one candle which has the highest volume

However all the pre-conditions needs to be met, Lets recap all the conditions to capture reversal from the bottom:

- 1■ The ongoing trend was downwards i.e. making fresh lows in intra for the day
- 2■ However, the volumes were shrinking whenever prices were making a fresh low, indicating no more interest by the sellers to push the prices to fresh low
- 3■ LL2 was not breached for the day

4■ Now wait for reversal

5■ The moment you get a significant volume, on the upside, play for reversal

6■ In this case, all you need to do is, if you sold CE's just exit them

Mitesh Sir's trades on March 4, 2022:

Post gap down, he had sold 35800 which was a PDH and also acted as a high for the past two days, the moment he spotted a reversal from the bottom, he exited from CE's at 12.35 hours

Reason: In current scenario, trading is based on news, so if in case there is a cease-fire, market might reverse entirely, so always have to have a SL

How to spot a reversal from the top?

Basis the below chart, he sold 35800 CE at 14.45 again

Worst case scenario:

Post selling a CE for the 2nd time, let's assume if the prices again start to move up, then you will have a surety of at least 80% that market is taking support of that level so in this case, the 2nd time after selling a CE, you can sell a PE to adjust it

In the first reversal, we won't sell PE's as we are not sure when it will reverse from the upside, especially when the overall market is in downtrend, however in the 2nd attempt one can take that risk after observing multiple supports

Another set-up: Rejection Candle:

■ Ongoing trend: upwards

■ After a small consolidation there is a BO

■ The very next candle rejected the entire upmove

■ Action: CE sell

One can utilize the same set-up for PE sell as well

■ ■ Ongoing trend: downwards

■ ■ After a small consolidation there is a BD

■ ■ The very next candle rejected the entire down move

■ ■ Action: PE sell

The key in finding rejections is to spot large sized candles

For intra-day all you need to focus is on huge candles

Spot the big candles, you need to act basis the break of the High or Low of that huge candle

Example 1: Here SL got hit

Nikita\_Poojary published on TradingView.com, Mar 06, 2022 11:30 UTC+5:30

Example 2: Trade worked here

Nikita\_Poojary published on TradingView.com, Mar 06, 2022 11:31 UTC+5:30

Rejection Set-up: You might get stopped out once twice or thrice , lets say each time it takes 10 points, but then whenever it turns in your favour, you'll be able to fetch 70-80 points

However for this you need to sell high premium options only then it will work

How to play Breakouts (BO)?

How to spot fake moves?

Nikita\_Poojary published on TradingView.com, Mar 06, 2022 12:06 UTC+5:30

Another set up to sell CE's with a small SL and a better R/R set up:

Strangles are not favorable on Friday, Monday & Tuesday in current environment i.e. high VIX

Better to play with reversal set ups on these days, with small SL

Overall profit/loss ratio would triumph the lower win ratio

Mitesh Sir trades only in weeklies & avoids monthly options, as it is difficult to predict the trend beyond 3 days

Trade set up: He uses one indicator i.e. VWAP, if prices trade > VWAP indicates buyers are strong & vice-versa

Thereafter, he relies only on big volume candles

How to initiate option selling during normal market conditions?

In times of normal market conditions when there are no gap ups & gap downs, then you just need to spot weekly S/R

During normal market conditions, spot the weekly Support & resistance

Scenario 1: if the prices are between both, one has to simply sell 1% above & below the resistance & support respectively to make consistent returns via options selling

Scenario 2: If price is hovering near support, only Sell CE's

Scenario 3: If price is hovering near resistance, only Sell PE's

Greedy traders think that they can eat prem on both sides while keeping their margin low as strangle attracts lower margin than directional

However during Scenario 2 & 3 such greedy positions traders would be badly screwed

Lets take the example of current weekly S/R i.e 34k & 36800, assuming VIX is normal & there are no news. In that case, as a positional trader one is supposed to sell only CE's

Lets understand the worst case scenario: if the market takes support of 34k and bounces back and starts to trade above 1.5% above the lows i.e. 34500-34550, then one can have an outlook to sell PE's as well as some kind of immediate bottom for the week has been made

So the idea is to then convert your directional only CE sell to strangle by selling a PE after it taking some support

However remember you don't have to exit the CE's unless the resistance of 36800 is taken out

Traders fear that the CE that they have sold at Rs. 50 has doubled i.e. 80-100-120 and they exit

However these are intermediary spikes, the moment prices hit the resistance and stays there, time decay will come into play

If the index really is trying to break the resistance, we can get the indication of the same by looking at volumes

If the market is trying to move up from lows, then buyers would wipe out all the sellers, in such case they need to absorb all the selling i.e. volumes will ■■■

So, if the volumes are going up along with the prices for 30min to 60mins then it is a clear indication that buyers are dominating

In such scenario, exit CE's and short only PE's

However if the price upmove is not backed by the surge in volume then stay in CE sell position

If the buyers really want to take the market up, they will buy as much as possible thereby witnessing a surge in volume & that too back to back candles will have huge volume

Big money/operators ■ can be tracked from volumes

So in case the CE option of Rs. 50 that you have sold has doubled, however there is no surge in volumes then you can stay in that CE and try to adjust it by selling a PE

The last adjustment is to convert the strangle into straddle.

Lets say the combined prem of that straddle is Rs. 600 then one can keep a SL of 600 on each side, now if the market still keeps trending on the upside the SL on the CE leg will get hit however the PE leg would give you some gains

And if one still has balance capital & if the trend is clear one can sell more PE's

Another scenario, even if one end up making a loss in the current week, the upcoming week one can sell a PE of higher prem as a strong base and support is made in the previous week

In option selling, one has to spot strikes which has high probability of going to 0

In case the market moves up strongly after taking a support of 34k (in normal market conditions) Mitesh Sir would sell 34k PE's

If the prices keep going up then he'll keep moving up his PE's

Eg: Spot = 34550 backed by higher b2b volumes, he will sell 34k PE, now if the index further moves to 34800-35k he would roll up his PE's to 34200

He would maintain a distance of 1.5% at all times as that will give him the time/cushion for adjustments in case of any

### Example 1: On huge candles and trade logic

NIFTY BANK, 1D, NSE O34526.10 H35097.75 L34094.10 C34407.80 -536.50 (-1.54%)  
Vol: The data vendor doesn't provide volume data for this symbol.

Mitesh Sir doesn't believe in Credit/Debit spreads

E.g.: Sell OTM strike X at Rs. 90

Buy far OTM strike X+500 points at Rs. 45

If the index goes down then:

Strike X = Rs. 70

Strike X + 500 = Rs. 35

Net reward: Rs. 10 only

Despite capturing the move, making only Rs. 10 ■

Lets say close to the expiry

Strike X = Rs. 10

Strike X+500 = Rs. 2

Now if you still holding this and in case there is a reversal

Strike X = 90

Strike X +500 = 0

Mitesh Sir, sells only those strikes which has 90% probability of going to 0

If you are using leverage by buying far OTMs to sell more qty

Leverage is a double edged sword, it will have a multiplier effect when you make money & similarly when you lose

So each individual needs to check the risk capacity and accordingly stick to their position sizing

The current SEBI norms of margins will ensure you won't lose more than 5% of your capital (if you are trading using only your capital w/o leverage)

One can make consistent 3% monthly return and if compounded works out to 38-40% p.a. which very few other business can generate

Traders are unsatisfied due to absolute returns instead of focusing on RoC

If your capital is low ~Rs. 10lacs & you are making 3-4lacs p.a. instead of being ■■■ by the absolute amt, be disciplined to make it consistently as compounding magic will play out in the longer term

@Mitesh\_Engr Sir himself targets only 1% a week via option selling

anything>1% is bonus

SL is always based on the levels and not on points or %

Needless to say @Mitesh\_Engr Sir has shared everything in detail & it is nothing less than a workshop in itself
