This is one of the sell signals I follow. It should give you some idea.

Since market cap of IRCTC is good, I reduced the move rule from 40% to 30% in this case. <https://t.co/qzL5rgmtg8>

Sell Signal - 3

-
- Value of ATR should rise above its 5, 13 & 22-Day WMA. MAs should get in uptrend sync, meaning 5-day WMA > 13-day WMA > 22-day WMA.
 - Volume should rise above its 5, 10 & 20-Day WMA. MAs should get in uptrend sync, meaning 5-day WMA > 10-day WMA > 20-day WMA.
 - Value of Standard Deviation should rise above its 13 & 22-Day WMA. MAs should get in uptrend sync, meaning 13-day WMA > 22-day WMA.
 - Price should advance 40% from buy signal at least.
 - When these action combine, Value of ATR rises 2-4 days in row, it indicates that a climax move is shaping up.
 - After that action in ATR, Volume & Standard Deviation & ATR rises up 2-4 days in a row, we start by counting the number of days the stock closed higher (up days) versus how many it closed lower (down days) in the last 10-15 days. As you count up days versus down days, you'll start seeing a shift where up days dominate down days. If we identify 70% or more up days in the last 10-15 days after the action in ATR, SD and Volume, which I just explained, that is the time to start selling aggressively into strength.

Just a small doubt . I sold Yesterday thinking it was a climax 6% move . How did you decide to sell today ?

Any rules where you sell positions . Just to learn
