To be clear, I am neither 'pro' nor 'anti' vaccination. A vaccination is a medical intervention. In the old (pre-hysteria) days, prior to March 2020, any doctor would confirm that any medical intervention should be based on a risk -v- reward analysis.....

The overall IFR of Coronavirus is around 0.2%, similar to seasonal flu. It's much lower for most people and you can assess your personal risk here:

For some reason, hysteria has taken over and we are now being held hostage to rushed, novel mRNA 'vaccines' which remain in Phase 3 trials and have not been fully assessed. Little, if anything, is known about potential iatrogenic effects.....

Cont.....

And these products have not been assessed in relation to (for example) interactions with other medications; their potential effects on people with existing auto-immune conditions etc.

They have been granted Emergency Use Authorisation only.....

Cont.....

5/n

And it is arguable that the EUA should now be withdrawn as more is now known about effective therapeutic medications such as ivermectin and others. Nevertheless, the vaccination ‘push’ continues apace despite numerous eminently qualified people questioning the safety.....

6/n

The Nuremberg Code requires that ‘fully informed consent’ is given by the recipient in advance of any medical intervention but the necessary information for such consent is not being offered routinely.....

Cont.....

7/n

This means that people are unaware of the potential risks and are lining up to take part in clinical trials without the full and proper information.

For information, the following series of tweets set out the concerns of some eminently qualified people.....

I do not claim that any of the following are ‘right’ or ‘wrong’ however the claims made must, surely, be taken seriously and tested to destruction before accepting this vaccine/gene-therapy being injected into the majority of the global population?

There are many more like this and I won't post them all here.

I would reiterate: Any medical intervention should be based on a risk -v- reward calculation and I am neither 'pro' nor 'anti' vaccine.

I do, however, have serious concerns based upon a reasoned argument.
