**Female athletes are still subjected to the equivalent of a sex test, based on whether they appear feminine.**

Dutee Chand in her successful appeal against the validity of the IAAF's hyperandrogenism regulations, the Athletics Federation of India (AFI) originally began investigating her after complaints that she "ran like a boy".

Chand was banned in 2014 after the AFI decided that her androgen (testosterone) levels were above the 10 nmol/L permitted by the IAAF's hyperandrogenism regulations, resulting in her missing the Glasgow 2014 Commonwealth Games.

Androgens, including testosterone, are naturally produced in significant – but varying – levels by both men and women.

Endocrine profiles in 693 elite athletes in the post-competition setting', found that 16.5% of the 'male' athletes had low testosterone levels, and 13.7% of the 'females' had high testosterone levels, 'with complete overlap between the sexes'.

The CAS suspended the regulations in 2015, ruling that the IAAF 'has not provided sufficient scientific evidence about the qualitative relationship between enhanced testosterone levels and improved athletic performance in hyperandrogenic athletes

# Indian sprinter **Dutee Chand** appeals against ban for failing 'gender test'

OCTOBER 8, 2014

[...] The IAAF has not established, on the balance of probabilities, that the Hyperandrogenism Regulations apply only to exclude female athlete that are shown to have a competitive advantage of the same order as that of a male athlete.'

The CAS has gave the IAAF until 27 July 2017 to provide scientific evidence to support its Hyperandrogenism Regulations, however no evidence has been presented to date in 2020.

Whilst the IAAF Regulations seek to impose an upper limit on female athletes, perhaps tellingly, no upper limit has been set for male athletes.

Dr. María José Martínez-Patiño successfully challenged her exclusion from the Spanish Olympic team in 1985 on the grounds that she had androgen insensitivity syndrome, a condition in which her body does not respond to testosterone, either natural or synthetic.

Dr. Martínez-Patiño pointed out that any women suffering from polycystic ovary syndrome will have elevated testosterone levels, but that does not make them an elite athlete.

If, as testosterone is such an important arbiter of performance as the IAAF argues, then how did Dr. Martínez-Patiño manage to compete to such a high level?

The scientific evidence suggests that testosterone levels vary amongst individuals and medical issues occur when an individual loses the ability to produce the testosterone their physiology requires.

There also is NO scientific evidence that natural (endogenous) testosterone levels are any kind of arbiter of sporting performance.
