A thread on windows facts you actually don't know.

Two different types of windows operating system:
1. Windows -> Old windows that doesn't exist anymore.
2. Windows NT -> The version that is used nowadays in modern microsoft computers.

1/n

Windows : It was old version of windows operating system. It was used in Windows 95, Windows 98, and Windows ME and was a ancestor of the old 16 bit versions of windows.

More ■

2/n

Windows NT: It is the never/modern version of Windows, It is used in every Windows version avaiable today. It was Firstly used in Windows 2000 and Windows XP. Windows NT comes with more recent/modern design that microsoft intiated in the early 1990s Windows.

More ■

3/n

Windows NT was designed as 32 bit processors capable. It had some new features like: Virtual memory, Multithreading and multiprocessor support.

In other words, Windows NT was/is a Modern Operating system.

4/n

Both(Windows and Windows NT) operating systems were made compatible of Win32 API, so that applications running on Windows can also run on Windows NT.

In 2001, Microsoft finally decided to eliminate the Windows product and offer only NT based systems.

5/n

The first general-purpose, consumer version of windows was Windows XP. which had some extremely amazing features that people never seen before at that time. It offered some major improvements for Windows 9x users

6/n

More tommorow, I was today busy in some work so didn't learned much.
