**How position sizing can affect your trading performance-**

**Assuming that you are trading a Trend-following system with Big RR and low win-rate.**

**For example, assume that you risk one percent per trade on a 100,000 account and you have 20 straight losses.**

That one percent is of your remaining equity and at the end of 20 losses, you would be down to 81,790.60.

Now if you got a 30R winner and you are risking one percent of your balance of 81,790.60, your new equity would be 106,327.9,

### WHEN YOU RISK 1% PER TRADE-

TRADE NO.	EQUITY	PROFIT/LOSS	CUMULATIVE EQUITY	DD%
1	10,00,000	-1000	99000	1
2	99000	-990	98010	1.99
3	98010	-980	97030	2.97
4	97030	-970	96060	3.94
---	---	---	---	---
16	86011	-860	85151	14.8
17	85151	-851	84300	15.7
18	84300	-843	83457	16.5
19	83457	-834	82623	17.3
20	82623	-826	81800	18.2
21	81800	+24780	106580	0

30R PROFIT IN 1 TRADE

ACCOUNT UP 6.5%

You've had 20 losses and one winner though you are still up 10Rplus your equity is up by 6.3R percent.

Now, let's say you risk five percent per trade on your balance. At the end of 20 straight losses, you would be down to 35,772.89 or down 64 percent.

### WHEN YOU RISK 5% PER TRADE-

TRADE NO.	EQUITY	PROFIT/LOSS	CUMULATIVE EQUITY	DD%
1	10,00,000	-5000	95000	5
2	95000	-4750	90250	9.75
3	90250	-4512	85738	14.2
4	85738	-4286	81452	18.5
---	---	---	---	---
16	48772	-2316	46334	55.9
17	46334	-2200	41818	58.1
18	41818	-2090	39728	60.2
19	39728	-1986	37742	62.2
20	37742	-1887	35855	64.1
21	35855	+53780	89635	10

30R PROFIT IN 1 TRADE

EVEN AFTER 30R PROFIT  
EQUITY IS 10% DOWN

If you risk five percent on this amount and get a 30R winner, you would be up to 89,621.48. You are up 10R, but because of your position sizing, your equity is still down over 10 percent.

#positionsizing

#Trading

#nifty50

This is why position sizing is the most important factor in trading if you get it right and you have an edge, you will do good.

Thanks for reading till here.
